SGA Memo \#10
TO: SGA Distribution
FROM: E. S. Muller
DATE: June 4, 1965
SUBJECT: b-Vectors for Angle and Angle Rate Measurements in Arbitrary Coordinate System

This memo presents b-Vectors for angle and angle rate measurements taken in a measurement coordinate system ( $M$-frame) and used to compute estimates of a state vector represented in a different system (e. g. platform frame-P frame).

The measurement gimbal system is that of the LEM rendezvous radar which tracks the CSM to obtain relative position ( R ) and velocity (V) of the CSM with respect to the LEM. The outer gimbal reads elevation angle ( $\beta$ ) and the inner gimbal reads azimuth angle $(\theta)$. The geometry is illustrated in Fig. 1. The b-Vector for a given measurement is in general a 6 -dimensional vector which may be represented as

$$
\underline{b}=\left[\begin{array}{l}
\underline{b}_{0} \\
\underline{b}_{3}
\end{array}\right] \text { where } \underline{b}_{0}, \underline{b}_{3} \text { are } 3 \times 1 \text { column vectors }
$$

and which satisfies

$$
\delta \mathrm{Q}=\underline{\mathrm{b}}^{\mathrm{T}} \delta \underline{\mathrm{x}}
$$

where

$$
\delta \mathrm{Q}=\text { deviation in measured quantity }
$$

$$
\delta \underline{\mathrm{x}}=\left[\begin{array}{l}
\delta \underline{\mathrm{r}} \\
\delta \underline{\mathrm{~V}}
\end{array}\right]=\begin{aligned}
& 6 \text {-dimensional state deviation vector } \text { with } \\
& \text { coordinates in } \mathrm{P} \text {-frame. }
\end{aligned}
$$

The vector $\delta \underline{x}$ represents deviations in position and velocity of the vehicle containing the tracking unit (the LEM in this case).

The rotation matrix which transforms vectors with $P$ frame coordinates to $M$-frame coordinates is $\mathcal{N}_{\mathrm{M}-\mathrm{m}}$. The three row vectors of this matrix are $\underline{m}_{0}, \underline{m}_{3}$, and $\underline{m}_{6}$, which are the three unit vectors representing the M-frame.

The b -Vectors corresponding to the two angle measurements $(\beta, \theta)$ and two angle rate measurements $(\dot{\beta}, \dot{\theta})$ are tabulated in Table I. All vectors are expressed in P -frame coordinates.

$$
\begin{aligned}
& \underline{A}=\left(\underline{R} \cdot \underline{m}_{0}\right) \underline{m}_{0}+\left(\underline{R} \cdot \underline{m}_{3}\right) \underline{m}_{3} \\
& A=|\underline{A}|, R=|\underline{R}|
\end{aligned}
$$

Fig. 1. Measurement frame geometry

|  | Table I |  |
| :---: | :---: | :---: |
| Measurement | b-Vector ( $6 \times 1$ ) |  |
|  | ${ }_{6}^{6}(3 \times 1)$ | $\underline{b}_{1}(3 \times 1)$ |
| Elevation angle ( $\beta$ ) | $\left(\underline{\mathrm{R}} \times \underline{m}_{6}\right) / \mathrm{A}^{2}$ | $\underline{0}$ |
| Azimuth angle ( $\theta$ ) | $\left(\left(\underline{R} \times \underline{m}_{6}\right) \times \underline{R}\right) / R^{2} A$ | $\underline{0}$ |
| Elevation angle rate $(\dot{\beta})$ | $\left(\underline{m}_{6} \times \underline{V}+2 \dot{\beta} \underline{\underline{A}}\right) / A^{2}$ | $\left(\underline{\mathrm{R}} \times \underline{m}_{6}\right) / \mathrm{A}^{2}$ |
| Azimuth angle rate ( $\dot{\theta}$ ) | $\begin{gathered} 1 / R^{2} A\left[\underline{V} \times\left(\underline{R} \times \underline{m}_{6}\right)\right. \\ +\underline{P}_{6} \times(\underline{R} \times \underline{V}) \\ \left.+\dot{\theta}\left(R^{2} \underline{A}+2 A^{2} \underline{R}\right) / \mathrm{A}\right] \end{gathered}$ | $\begin{aligned} & \left(\left(\underline{R} \times m_{6}\right) \times\right. \\ & \underline{R}) / R^{2} A^{2} \end{aligned}$ |
