## Display Computations

GET+MGA Entered with TS = active vehicle velocity increment

$$
\begin{aligned}
& \mathrm{TS}_{1}=\sin ^{-1}\left(\text { unitTS } \cdot \operatorname{REFSMMAT}_{3}\right) \\
& \text { If } \mathrm{TS}_{1}<0 \text { : } \\
& \quad \mathrm{TS}_{1}=\mathrm{TS}_{1}+1 \quad \text { (the } 1 \text { is } 360^{\circ} \text { ) } \\
& \text { pMGA }=\mathrm{TS}_{1} \\
& \text { Return }
\end{aligned}
$$

GET.LVC Entered with TS = active vehicle velocity increment

$$
\begin{aligned}
& \mathrm{TS}_{3}=- \text { unit} \underline{R}_{\text {init }} \\
& T \underline{S}_{2}=\text { unit }\left(T \underline{S}_{3} * \underline{\mathrm{~V}}_{\text {init }}\right) \\
& T \underline{S}_{1}=\operatorname{unit}\left(\mathrm{TS}_{2} * \mathrm{TS}_{3}\right) \\
& \text { DELVLVC}=\left[\begin{array}{l}
T \underline{S}_{1} \\
T \underline{S}_{2} \\
T \underline{S}_{3}
\end{array}\right] \quad \mathrm{TS}
\end{aligned}
$$

Return
CALCN83 Entered after Average-G in P47, from "TIGON" setting
DV47TEMP $=\underline{V}_{\text {gbody }}+$ DELVREF $\quad\left(\underline{V}_{\text {gbody }}\right.$ notation also "DELVCTL")
$T \underline{S}=$ DV47TEMP
Perform "S41.1"
DELVIMU $=$ T $\underline{S}$
VMAGI $=|\underline{\mathrm{V}}|$
HDOT $=$ unitl $\underline{R} \quad \underline{V} \quad$ (writes over UTYAW, RI of $N$ 「 7 )
$T S=K_{r p a d}$
If bit 2(AMOONFLG) of FLAGWRDO = 1:

$$
T S=|R L \underline{S}|, \text { rescaled to scale factor B29 }
$$

ALTI $=|\underline{R}|-T S \quad$ (writes over UTPIT, R2 of N78, and low half of N31)
Inhibit interrupts
$\underline{V}_{\text {gbody }}=$ DV47TEMP
Proceed to "SERVEXIT" (where interrupts release as part of restart logic)
CALCN85 Entered after Average-G in P40 (from "P4ORCS" setting) and P4I (from "P4OSXTY" setting)

Perform "UPDATEVG"
$T \underline{S}=\underline{V}_{\text {gtig }}$
Perform "S41.1"
$\underline{V}_{\text {gbody }}=T \underline{S}$
Proceed to "SERVXTI"
SBANDANT Established by "VB64" for a V64E. This is R05.
$T_{1}=T_{\text {now }}$
Perform "CDUTRIG"
$T_{\text {decl }}=T S_{1}$
Perform "CSMCONIC"
If $\mathrm{X} 2=0$ : (means earth-centered)

$$
\underline{R}_{s b}=-\underline{R}_{a t t}
$$

If $\mathrm{X} 2 \neq 0$ : (means moon-centered)

$$
\underline{R}_{s b}=\underline{R}_{a t t}
$$

$$
\mathrm{TS}=\mathrm{T}_{\text {att }}
$$

Perform "LUNPOS"
$\underline{R}_{s b}=-\left(T \underline{S}+\underline{R}_{s b}\right)$
$\underline{R}_{s b}=[$ REFSMMAT $] \underline{R}_{s b}$
YAWANG $=0$
$T \underline{S}=\underline{R}_{s b}$
Perform "*SMNB $*$ "
$\underline{R}_{s b}=T \underline{S}$
$T \underline{S}_{1}=\underline{R}_{s b}-\left(\underline{R}_{s b} \cdot u n i t \underline{Z}\right) u n i t \underline{Z}$
$T \underline{S}_{2}={u n i t T \underline{S}_{1}}^{1}$
If $\mathrm{TS}_{2}$ does not generate overflow (e.g. a $T \underline{S}_{1}$ component $\geqslant 2^{8}$ meters):
YAWANG $=\cos ^{-1}\left(\mathrm{TS}_{2} \cdot\right.$ unitX $)$
If $\left(T \underline{S}_{2} \cdot u n i t Y\right)<0:$
YAWANG $=\left(1-2^{-28}\right)-$ YAWANG
RHOSB $=\cos ^{-1}$ (unitr sb $_{\text {a }} \cdot$ unitZ) $-\frac{1}{4} \quad$ (the $\frac{1}{4}$ is 90 degrees)
GAMMASB $=$ YAWANG
Change priority of present job to $\mathrm{O}_{\mathrm{f}}$
If bit 5 of EXTVBACT $=0$ : (means display response received)
Proceed to "ENDEXT"
$T S=0651_{\mathrm{vn}}$
Perform "GOMARKFR": if terminate, set bit 5 of EXTVBACT $=0$ and End of job if proceed, set bit 5 of EXTVBACT $=0$ and End of job otherwise, End of job
$T S=100$ and perform "BLANKET" (R3BLNK)
Change priority of present job to $\mathrm{O}_{\mathrm{g}}$
Delay 0.01 second (by putting job to sleep via "DELAYJOB")
Proceed to "SBANDANT"
V82CALL Entered from "V82PERF" for a verb 82. This is R30.
If bit I(AVEGFLAG) of FLAGWRDI = 1 :
Establish "V82GON1" (priority 07g, with VAC area)
Perform jobs of "higher" priority if waiting ("V82GON1" will be since VAC-area ones of a given priority are considered higher than non-VAC jobs)
$T S=1644 \mathrm{vn}$
Proceed to "GOXDSPF": if terminate, set bit 5 of EXTVBACT $=0$ and End of job
if proceed, set bit 5 of EXTVBACT $=0$ and End of job otherwise, proceed to previous line

OPTIONX $=2$ (Average-G not running if come here)

OPTIONX+1 = 1 (means computation for this vehicle)
$T S=0412 \mathrm{vn}$
Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT" if proceed, proceed otherwise, proceed to previous line

Call "TICKTEST" in 0.08 seconds
Proceed to "V82GOFLP"

## V82GOFLP

V82FLAGS $=0$
Establish "V82GOFFI" (priority 07g, with VAC area)
If bits 2-1 of V82FLAGS $=0_{2}$ : (set after data from "V82GOFFI")
Delay 1 second (by putting job to sleep via "DELAYJOB")
Proceed to second previous line (recheck bits 2-1)
$\mathrm{TS}=1644 \mathrm{vn}$
Proceed to "GOXDSPF": if terminate, set bit 5 of EXTVBACT $=0$ and End of job
if proceed, set bit 5 of EXTVBACT $=0$ and End of job otherwise, proceed to "V82GOFLP"

V82GON1 Established at start of "V82CALL" if Average-G on.
Set $\underline{R}_{\text {one }}=\underline{R}$ and $\underline{V}_{\text {one }}=\underline{V} \quad$ (both from same Average-G cycle)
If bit 2(AMOONFLG) of FLAGWRDO $=0$ :
Set bit 13(V82EMFLG) of FLAGWRD9 $=0$ (means earth-centered)
TFFdRTMU $=K_{\text {Idrtmue }}$
HPERMTN $=K_{\text {minpere }}$
RPADTEM $=K_{\text {rpad }}$
Set bit 12(LUNLATLO) of FLAGWRD3 $=0$
If bit 2(AMOONFLG) of FLAGWRDO = 1:
Set bit 13(V82EMFIG) of FLAGWRD9 = 1 (means moon-centered)
TFFdRTMU $=K_{\text {Idrtmum }}$
HPERMIN $=K_{\text {minperm }}$
RPADTEM $=\mid$ RLS $\mid$
Set bit 12(LUNLATLO) of FLAGWRD3 = 1

Perform "SR30.1"
If $\mathrm{MODREG}=11$ :
Perform "INTSTALL"
Perform "DELRSPL" (continues below if MODREG $\neq 0$, as it should)
If bit 5 of EXTVBACT $=0$ : (means display response received)
Proceed to "ENDEXT"
Delay 1 second (by putting job to sleep via "DELAYJOB")
Proceed to "V82GONI"
V82GOFF1 Established by "V82GOFLP" if Average-G off.
DSPTEMX $=0$
$\mathrm{TS}=0616_{\mathrm{vn}}$
Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT" if proceed, proceed otherwise, proceed to previous line

TS = DSPTEMX
If DSPTEMX $=0$ :
$T S=T_{\text {now }}$
$T_{\text {decl }}=T S$
$T_{\text {start82 }}=T S \quad$ (note that time origins remain present time, not N16 time) If $|O P T I O N X+1| \leqslant 1$ :

Perform "CSMPREC"
If $|O P T I O N X+1|>1$ :
Perform "LEMPREC"
$\underline{R}_{\text {one }}=\underline{R}_{\text {att }} \quad$ (Tag here "BOTHSHIP")
$\underline{V}_{\text {one }}=\underline{V}_{\text {att }}$
If $\mathrm{X} 2=0: \quad$ (means earth-centered)
Set bit 13(V82EMFLG) of FLAGWRD9 $=0$
TFFdRTMU $=K_{\text {ldrtmue }}$
HPERMIN $=K_{\text {minpere }}$
(If $\mathrm{X} 2=0$ ) :
RPADTEM $=K_{\text {rpad }}$
Set bit 12(LUNLATLO) of FLAGWRD3 $=0$
If $\mathrm{X} 2 \neq 0$ : (means moon-centered)
Set bit 13(V82EMFIG) of FLAGWRD9 = 1
TFFdRTMU $=K_{\text {Idrtmum }}$
HPERMIN $=K_{\text {minperm }}$
RPADTEM $=|R L \underline{S}|$
Set bit 12 (LUNLATLO) of FLAGWRD3 $=1$
Perform "SR30.1"
If MODREG = 0:
Perform "INTSTALL"
Perform "DELRSPL" (to next line if MODREG $=0$, as it should)
$T_{\text {start82 }}=T_{\text {now }}-T_{\text {start } 82}$
If mTPER $=0: \quad$ (i.e. perigee not $\geqslant$ HPERMIN)

Return

## Quantities in Computations

See also list of major variables and list of routines

ALPHAV: See Coordinate Transformations. Only the Z component is required for "GETERAD".

ALT: See Coordinate Transformations. It is loaded briefly in "DELRSPL" with the X component of DELVLVC because this is the "third component" of LATSPL and LNGSPL and a vector operation is used (this transient loading might be noticed if a monitor verb were being used with a noun that displays ALT, and therefore is shown in the programmed equations).

## ALTI: See Boost Computations.

BASEOTP: Value of LM position vector at BASETTME computed in "V83CALL", scale factor B29(earth) or B27(moon), units meters. Subsequent computations of LM position in R31/R34 start with this position and perform precision integration (if Average-G is on) or conic integration (if Average-G is off). Cell used for VECTAB V (page ORBI--17). $_{6}$ )
BASEOTV: Value of LM velocity vector at BASETIME computed in "V83CALL", scale factor B7(earth) or B5(moon), units meters/centi-second. See BASEOTP. Cell used for VECTAB ${ }_{18}{ }^{\circ}$
BASETHP: Value of CSM position vector at BASETIME computed in "V83CALL", scale factor B29(earth) or B27(moon), units meters. If Average-G is on, the quantity is not used, but instead state vector information from Average- $G$ is employed. If Average- $G$ is off, however, subsequent computations of CSM position in R3l/R34 start with this position and perform the integration. Cell used for VECTAB $3_{30^{\circ}}$
BASETHV: Value of CSM velocity vector at BASETIME computed in "V83CALL", scale factor B7(earth) or B5(moon), units meters/centi-second. See BASETHP. Cell used for RPQV (see Orbital Integration).
BASETIME: Value of time tag associated with BASEOTP/ $\underline{V}$ and BASETHP/ $\underline{V}$, scale factor B28, units centi-seconds.

Cemsalt: Erasable memory constant, program notation "EMSALT", scale factor B29, units meters, giving the altitude above the Fischer ellipse where the Entry Monitor System is to be initialized. The latitude argument for determining the Fischer ellipse value is determined from $K_{\text {rtrial }}$.
Cunitw : See General Program Control.
CDUS, CDUT: See Optics Computations.
COSDELF: Cosine of the "transfer angle" between TFRMAG and TFRTERM, scale factor Bl. Program notation "CDELF/2", stored in pushdown list location 14 D .

DELVIMU: Velocity increment in control axes computed in "CALCN83", scale factor $B 7$, units meters/centi-second, used in P47 only. Value can be zeroed by entry of a recycle verb (see "P47BODY"). Cumulative sum of velocity, in reference coordinates, kept in $\underline{V}_{\text {gbody }}$ cells (note
that in this case they are not control coordinates).

DELVLVC: See Burn Control.
DELVREF: See General Program Control.
DSPTEMX: Display temporary cells used to contain time for e.g. R30 and R36, scale factor B28, units centi-seconds, displayed by N16. Cells are the same as DSPTEM $2+1_{d p}$ : the "X" signifies "extended verbs".
DTEAROT: See Coordinate Transformations.
DV47TEMP: Value of summed velocity increment loaded at start of "CALCN83" and transferred to $\underline{V}_{\text {gbody }}$ at end, scale factor B7, units meters/ centi-second in refefence coordinates. Used for restart protection of the summing process, and stored in the same cells as $\mathrm{V}_{\mathrm{g}}$ (see Steering Computations).

ERADM: See Coordinate Transformations.
EXTVBACT: See Verb Definitions.
GAMAE: Value of flight path angle at 300,000 feet, used to compute GMAX, "positive down", stored in push-down list address 2D, units revolutions.

GAMMAEI: Single precision value of flight path angle at 400,000 feet, scale factor BO, units revolutions (will be negative). It is the "angle between the inertial velocity vector and local horizontal" at 400,000 feet above the Fischer radius. For telemetry convenience, the "least significant half" of GAMMAEI is JJ, loaded at the end of "S61.2" with RTGO ${ }_{\text {sp }}$. See also Return to Earth Computations.

GAMMASB: Value of "yaw angle" for display in R2 of N51, scale factor BO, units revolutions, in range 0 to 360 degrees, giving S-band antenna "yaw pointing angle".

GAMTERM: Value of flight path angle e.g. at TFRTERM, scale factor BO, units revolutions, computed in a subroutine. Angle is measured as described for GAMMAEI, except that it is positive (hence could be considered as absolute value of flight path angle). When used as a communication cell with "AUGEKUGL", is retained in push-down list location 2D (and is at the same point as VTERM).
GMAX: Value of predicted maximum drag, scale factor B14, units of 0.01 g's. Computed double precision, but least significant half is not used in generating the display, so is written over by the most significant half of VMAGI after start of "CM/POSE" computations.

HAPOX: Value of apocenter altitude computed in "SR30.I", scale factor B29, units meters, displayed by N44. The "X." signifies "extended verb", since cell distinct from one in e.g. P30, HAPO.

HDOT: See Boost Computations.
HPERX: Value of pericenter altitude computed in "SR30.1", scale factor B29, units meters, displayed by N44. See HAPOX.
HPERMIN: Value of interface altitude used for R30 as the basis for computing TFF (if periapsis altitude not below this level, then mTPER is also computed). Scale factor is B29(earth) or B27 (moon), units meters.
JJ: See Entry Computations. Loaded with RTGO ${ }_{\text {sp }}$ at end of "S61.2" for
telemetry purposes (see GAMMAEI).
$K_{\text {ldrtmu }}$ : Constant, program notation "l/RTMU", scale factor B-17, value $0.5005750271 \mathrm{E}-5 \times 2^{17}$. Constant used only for initialization of TFFdRTMU in "S61.2" computations, and corresponds to the reciprocal of the square root of $3.98603223 \mathrm{ElO} \times 1.0012$ (with binary scale factor), where first term is earth $\mu$ (meters ${ }^{3} / \mathrm{cs}^{2}$ ) and second is a factor for "near earth trajectory", representing an increase of $0.12 \%$. If $C$ emsalt indicates a lunar return, however,
$K_{\text {Idrtmue }}$ : Constant, program notation "l/RTMUE", scale factor B-17, value $0.50087529 \mathrm{E}-5 \times 2^{17}$, corresponding to reciprocal of root of unmodified earth $\mu$ (same value as $K_{\text {mutab }}$ in Conic Routines).
$K_{\text {ldrtmum }}$ : Constant, program notation "1/RTMUM", scale factor B-14, value $0.45162595 \mathrm{E}-4 \times 2^{14}$, corresponding to reciprocal of root of moon $\mu$. (same value as $K_{\text {mutab }}$ i4 Conic Routines).
$K_{\text {lsec }}$ : Constant, program notation "ISEC", scale factor B28, units centi-seconds. Value is $100 \times 2^{-28}$, corresponding to 1 second (as used). It is added to mTPER or TFF in "TICKTEST" to update time of display (if Average- -G is not running) so as to reflect more closely the "time to" the indicated trajectory point (both times normally would be minus and the addition causes them to "count down").
$K_{2 \text { pib5 }}$ : Constant, program notation "PI/16", scale factor B5, value $3.141592653 \times 2^{-4}$, corresponding to $2 \pi \times 2^{-5}$ (also used with scale factor $B 4$, shown as $\frac{1}{2} K_{2 p i b 5}$, to give effect of $\pi$ ).
$\mathrm{K}_{20 \mathrm{kf}}$ : Constant, program notation "20KFT/S", sçale factor B6, units meters/centi-second. Value is $121.92 \times 2^{-7}$, corresponding to $20,000 \times 0.3048 \times 10^{-2} \times 2^{-6}$, where first term is "basic" value in fps, second converts from feet to meters, third converts to centi-seconds, and fourth is scale factor.
$\mathrm{K}_{36 \mathrm{kf}}$ : Constant, program notation "36KFT/S", scale factor B7, units meters/centi-second. Value is $109.728 \times 2^{-7}$, corresponding to $36,000 \times 0.3048 \times 10^{-2} \times 2^{-7}$, where first term is "basic" value in fps, second converts from feet to meters, third converts to centi-seconds, and fourth is scale factor.
$K_{290 k f t}$ : Constant, program notation "290KFT", scale factor B29, units meters. Value is $88392 \times 2^{-29}$, corresponding to $290,000 \times$ $0.3048 \times 2^{-29}$, where first term is "basic" value in feet, second converts from feet to meters, and third is scale factor.
$K_{400 k f t}$ : Constant, program notation "400KFT", scale factor B29, units meters. Value is $121920 \times 2^{-29}$, corresponding to $400,000 \times$ $0.3048 \times 2^{-29}$, where first term is "basic" value in feet, second converts from feet to meters, and third is scale factor.
$K_{b 22 i m}:$ Constant, program notation "LIM(-22)", octal value 377778 37700 , but used in program in such a way (a forcing of overflow) that effective value corresponds to 100 , or $2^{-22}$. If TFFDEN scaling is B3, this represents a "true" value of $2^{-19}$; if TFFDEN scaling is Bl6, this represents a "true" value of $2^{-6}$; and if TFFDEN scaling is Bl5 (moon), true value is $2^{-7}$.
$K_{\text {cklk2. }}$ ( $i=-10$ to 0 in increments of 2 ): Value of additive constant $i$ in computing PDK1 ( $i=-10,-8,-6$ ) and PDK2 ( $i=-4,-2,0$ ) in "AUGEKUGL", program notation (for $i=0$ ) "CK1K2", scale factors all BO. For $i=0,-2,-4$, constants are in units of revolutions:

| $\underline{i}$ | Value | Equivalent to |
| ---: | ---: | ---: |
| 0 | $6.6666666 \mathrm{E}-3$ | 2.4 degrees |
| -2 | $2.7777777 \mathrm{E}-3$ | 1.0 degrees |
| -4 | $-8.8888888 \mathrm{E}-3$ | -3.2 degrees |

For $i=-6,-8,-10$, constants are in units of revolutions $/ 360$, to give a PHIE result in units of revolutions. Conversion value between nautical miles and (rev/360) is 7.776E6, which is 21600 x 360. The 21600 in turn is $2 \pi \times 3437.7468 \mathrm{nmi}$ (about 6366707 meters as contrasted with 6373338 meters for pad radius and scaling of RSPmRREC for display). Values are:

| i | Value |
| :--- | :--- |
| -6 | $3.08641975 \mathrm{E}-4$ |
| -8 | $3.08641975 \mathrm{E}-4$ |
| -10 | $7.07304526 \mathrm{E}-4$ |

Equivalent to
$-6 \quad 3.08641975 \mathrm{E}-4$ 2400/7.776E6 (2400 nmi)
$-10 \quad 7.07304526 \mathrm{E}-4$
Same as $i=-6$
5500/7.776E6 (5500 nmi)
$K_{\text {ktetal }}$ : Constant, program notation "KTETAl", scale factor B28, units centi-seconds/revolution. Value is $42.1844723 \times 2^{-14}$, corresponding to $1100 \times 100 \times 2 \pi \times 2^{-28}$, where first term is "basic" value (seconds/radian), second converts to centi-seconds, third converts to revolutions, and fourth is scale factor. Cf. $K_{\text {kteta }}$ in Entry Computations.
$K_{m 6 p 05 d}$ : Constant, program notation "-6.05DEG", scale factor BO, units m6p05d revolutions. Value is -0.016805556 , corresponding to -6.05 degrees.
$K_{\text {maxnm }}$ : Constant, program notation "MAXNM", scale factor B29, units meters. Octal value is 01065 g 05603 , corresponding to 18519.814 kilometers, or about $9999.8995^{8} \mathrm{nmi}$ (DSKY routine display 9999.9 nmi ).
$K_{\text {maxphic }}$ : Constant, program notation "MAXPHIC", scale factor BO, units where first term is value in nmi and second (see $\mathrm{K}_{\mathrm{cklk}}$ ) converts to rev.
$K_{\text {minpere }}$ : Constant, program notation "MINPERE", scale factor B29, units meters. Value is $91440 \times 2^{-29}$, corresponding to $300,000 \times 0.3048$ x $2^{-29}$, where first term in "basic" value in feet (about 49.37365 nmi), second converts to meters, and third is scale factor. Constant also referenced by tag "300KFT".
$K_{\text {minperm }}$ : Constant, program notation "MINPERM", scale factor B27, units meters. Value is $10668 \times 2^{-27}$, corresponding to $35,000 \times 0.3048$ $\times 2^{-27}$, where first term is "basic" value in feet, second converts to meters, and third is scale factor.
$K_{r l}$ : Constant, program notation "KRI", scale factor B-2, units revolutions. Value is -0.026666667 , corresponding to $-2.4^{\circ}$.
$K_{r 2}$ : Constant, program notation "KR2", scale factor B18, octal value $21450 \mathrm{~g}_{8} 0001_{8}$. Without the non-zero least significant half, value corresponds to $4 \times 360 \times 10^{2} \times 2^{-18}$ (or $9000 \times 2^{-14}$ ), where first term is "basic" value, second converts from revolutions to degrees, third scales to 0.01 g , and fourth is scale factor.
$K_{r 3}$ : Constant, program notation "KR3", scale factor B14, value 1000 x $2^{-14}$. Value corresponds to $10 \times 10^{2} \times 2^{-14}$, where the first term is equal to $10-10(x-.3)$ for $x$, the nominal $L / D$, equal to 0.3 ; the second term scales to 0.01 g , and the third is the scale factor: formula obtained from previous programs where $\mathrm{x} \neq 0.3$.
$K_{r 4}$ : Constant, program notation "KR4", scale factor B-2, value 0.833333333 . Since it divides VBARSQ, has an effect equivalent to multiplying it by $(5 / 6)^{-1} \times 2^{2}=4.80$ 。
$K_{\text {rapmax }}$ : Constant, program notation "NEARONE", scale factor B29(earth) rapmax or $\mathrm{B}_{2} 7$ (moon), units meters. Value is ( $1-2^{-28}$ ), corresponding to ( $2^{29}-2$ ) meters for earth and $\left(2^{27}-\frac{1}{2}\right)$ meters for moon.
$K_{\text {rpad }}$ : See Burn Control.
$K_{\text {rtrial }}$ : Constant, program notation "RTRIAL", scale factor B29, units meters: according to program comments, this is intended to be 284643 feet above a "pad" of 6373338 meters (actually is about 284645.67 feet).
$K_{\text {tgr26con }}$ : Constant, program notation "TGR26CON", scale factor B28, units centi-seconds/revolution. Used to compute $T$ ent from PHIE for velocity equal to or greater than 26,000 fps (hence the notation). Value is $7.2 E 5 \times 2^{-28}$, corresponding to ( $1 / 3$ ) $\times$ $21600 \times 10^{2} \times 2^{-28}$, where first term is "basic" value (for PHIE in nmi and answer in seconds), second converts from revolutions to nmi (see K ckık2), third converts to centi-seconds, and fourth is scale fact8r.
$K_{\text {tless } 26: \text { Constant, }}$ program notation "TLESS26", scale factor B35, value $5.70146688 E 7 \times 2^{-35}$. Used to compute $T$ from PHIE and VTERM for velocity less than 26,000 fps (hence the notation). Decimal value corresponds to $8660 \times 21600 \times 0.3048$, where first term is "basic" value (for PHIE in nmi and velocity in fps), second converts from revolutions to nmi (see K velocity distance unit from meters to feetk conversion of time unit to seconds from centi-seconds not done since time units of T ent are centi-seconds).
$K_{t x 0}-K_{t x 5}$ : Coefficients in a series expansion used in time-of-flight calculation, all with scale factor BO. For positive argument, function is $\left(\sqrt{x}-\tan ^{-1} \sqrt{x}\right) / x^{3 / 2}$; for negative argument, function is $\left(\sqrt{-x}-\tanh ^{-1} \sqrt{-x}\right) /-x^{3 / 2}$. According to the program comments, the polynomial was fitted for this flight over the range $0-1$, and has a maximum error of $2 \mathrm{E}-5$. Program notation " $T(X)+2$ ".

Constant Value Infinite-Series Value
$\mathrm{K}_{\text {txO }} \quad 3.33333333 \mathrm{E}-1 \quad 1 / 3$
$\mathrm{K}_{\text {txl }} \quad-1.999819135 \mathrm{E}-1 \quad-1 / 5$
$\begin{array}{lll}K_{\mathrm{tx} 2} & 1.418148467 \mathrm{E}-1 \quad 1 / 7\end{array}$
$K_{t x 3}-1.01310997 \mathrm{E}-1 \quad-1 / 9$
$\mathrm{K}_{\mathrm{tx} 4} \quad 5.609004986 \mathrm{E}-2 \quad$ l/ll
$K_{\text {tx } 5} \quad-1.536156925 \mathrm{E}-2 \quad-1 / 13$
$K_{\text {V2lk }}$ : Constant, program notation "V(21K)", scale factor B7, units meters/centi-second. Value is $64.008 \times 2^{-7}$, corresponding to $21000 \times 0.3048 \times 10^{-2} \times 2^{-7}$, where first term is value in fps, second converts to meters, third to centi-seconds, and fourth is scale factor.
$K_{\text {v26k }}$ : Constant, program notation $" \mathrm{~V}(26 \mathrm{~K})$ ", scale factor B7, units meters/centi-second. Value is $79.248 \times 2^{-7}$, corresponding to $26000 \times 0.3048 \times 10^{-2} \times 2^{-7}$, where first term is value in fps , second converts to meters, third converts to centi-seconds, and fourth is scale factor.
$K_{\text {v32k. }}$ ( $i=-10$ to 0 in increments of 2): Values of subtractive velocity i constant in computing PDK1 ( $i=-10,-8,-6$ ) and PDK2 ( $i=-4$, $-2,0$ ) in "AUGEKUGL", program notation (for $i=0$ ) "V ( 32 K )", scale factor $B$ Y, units meters/centi-second. To convert a value in fps to meters/centi-second, multiply by $0.3048 \times 10^{-2} \times 2^{-7}$, where first term converts to meters, second converts to centiseconds, and third is scaling.

| i | Notation | Value | Equivalent to |
| ---: | :---: | :---: | ---: | ---: |
| 0 | $V(32 K)$ | $97.536 \times 2^{-7}$ | $32,000 \mathrm{fps}$ |
| -2 | --- | $85.344 \times 2^{-7}$ | $28,000 \mathrm{fps}$ |
| -4 | $V(24 K)$ | $73.152 \times 2^{-7}$ | $24,000 \mathrm{fps}$ |
| -6 | $V(3 K)$ | $9.144 \times 2^{-7}$ | $3,000 \mathrm{fps}$ |
| -8 | $V(28 K)$ | $85.344 \times 2^{-7}$ | $28,000 \mathrm{fps}$ |
| -10 | $V(400)$ | $1.2192 \times 2^{-7}$ | 400 fps |

$K_{V 4 K}$ : Constant, program notation "V (4K)", scale ${ }^{2}$ factor B7, units meters/centi-second. Value is $12.192 \times 2^{-7}$, corresponding to $4000 \times 0.3048 \times 10^{-2} \times 2^{-7}$, where first term is value in fps, second converts to meters, third converts to centi-seconds, and fourth is scale factor.
$K_{\text {vemscon }}$ :Constant, program notation "VEMSCON", scale factor Bl4, value $-0,0389676 \times 2^{-14}$. Value corresponds to ( -1.5 IE6) $x$ $(0.3048 / 100)^{2} \times(1 / 360) \times 2^{-14}$, where first term is "basic" value (for velocities in fps and angles in degrees), second term converts denominator to units of fps and also converts final answer from fps to meters/centi-second, third term converts angle in denominator from revolutions to degrees, and fourth term is the scale factor. Stored value is 77777 g $76601_{8}$, corresponding to about $-0.03894043 \times 2^{-14}$ : this gives a basic value of about $-1.508945 \mathrm{E} 6$.
$K_{\text {yklk2. }}$ ( $i=-10$ to 0 in increments of 2): Value of constant multiplying i velocity information in computing PDK1 ( $i=-10,-8,-6$ ) and PDK2 ( $i=-4,-2,0$ ) in "AUGFKUGL", program notation (for $i=0$ ) "YKIK2", scale factors all B-7. For $i=0,-2,-4$, basic value is for data in degrees and $f p s$, and must be multiplied by (100/0.3048) x (1/360) to convert to proper velocity information and revolutions.

| i | Value | Equivalent to |
| ---: | :--- | :--- |
| 0 | $2.59733157 \mathrm{E}-4 \times 2_{7}^{7}$ | $2.85 \mathrm{E}-4$ |
| -2 | $9.56911636 \mathrm{E}-4 \times 2^{7}$ | $1.05 \mathrm{E}-3$ |
| -4 | $1.11639691 \mathrm{E}-3 \times 2^{7}$ | $1.225 \mathrm{E}-3$ |

For $i=-6$ and -10 , the value of the constant is 0 . For $i=-8$, value is $-1.86909989 \mathrm{E}-5 \times 2$. This value corresponds to -0.443 x (100/0.3048) x (1/7.776E6) x $2^{7}$, where first term is "basic" value (to give a PHIE in nautical miles), second converts velocity from meters/centi-second to feet/second, third is the conversion factor discussed with $K_{c k l k 2}$, and fourth is scale factor.

LAT: See Coordinate Transformations.
LATSPL: Input information on target latitude, program notation "LAT(SPL)", scale factor BO, units revolutions. Can be displayed in Rl of N6l, and should form part of prelaunch erasable load for use in computing RSPmRREC. Cell also used to input target information for entry equations. Information is geodetic latitude.

LNGSPL: Input information on target longitude, program notation "LNG(SPL)", scale factor BO, units revolutions. Can be displayed in R2 of N61 (see LATSPL). See also Return to Earth Computations.

LONG: See Coordinate Transformations.
MM: See Entry Preparation.
mTPER: Value of time from per.alt., scale factor B28, units centi-seconds, program notation "-TPER". It is set 0 if HPERX is below HPERMIN. If V82 is entered with Average-G off, time on display is updated every second by "TICKTEST" (after being corrected near end of "V82GOFF1" for computation delay since sampling time of state vector) by being incremented by 1 second every second (hence display could become positive if perigee passed, while a termination and reselection of V82 would give a negative time again, namely time until the next perigee). If Average-G is on, however, computation is recycled every second (plus computing delays) via "V82GON1", and no updating of mTPER is otherwise performed. If HPERX is below HPERMIN, update is of TFF instead of mTPER.

OPTIONX: Cells displayed by N12, and intended for use in a fashion similar to OPTION1, OPTION2, but with extended verbs. Same cells as DSPTEMX+1. Program notation for OPTIONX+1 also "OPTIONEV".

PDKI: Value of equation quantity "K " (numerator term for PHIE in "AUGEKUGL" routine), units of ${ }^{1}$ "revolutions/360" (or revolutions ${ }^{2}$, so that division by revolutions gives result in revolutions), scale factor BO, stored in push-down list location $4 D$.

PDK2: Value of equation quantity " $\mathrm{K}_{2}$ " (term in denominator for PHIE in "AUGEKUGL" routine), scale factor BO, units revolutions, stored in push-down list location 6D.

PHIE: Value of "empirically estimated entry range", scale factor BO, units revolutions, stored in push-down list location 4D. A factor of 21600 is used with constants expressed in nmi to convert to revolutions in deriving PHIE (see "AUGEKUGL" quantities).
pMGA: Value of "positive middle gimbal angle", program notation "+MGA", scale factor BO, units revolutions. Set to cause a display of -0.02 degrees if nominal flow would require a display but the bit indicating valid [REFSMMAT] is not set; set to cause a display of -0.01 degrees if computation flow does not require angle display (e.g. not the final pass through rendezvous computations). Otherwise, should be a positive number in range 0-90 degrees (or $270-$ 360 degrees). Quantity therefore shows the value of the middle
gimbal angle (if positive) when the +X axis is aligned with the impulsive thrust direction. Cell also loaded in "PROG22" with similar information, except that angle range there is only $0-90^{\circ}$.
Rinit: See Rendezvous Computations. Cell also used as a communication one $^{\text {R }}$. with "GET.LVC" to define local-vertical coordinate system.
$\underline{R}_{\text {one }}$ : Position vector used to achieve a constant state vector for use within display computations. Rescaled in "SR30.1" to scale factor B27 if moon centered (otherwise, left at original B29 scaling), units meters. Also loaded in "NEWRNVN" with present position vector for use in "S6l.2" computations. Also loaded in "HAVEBASE" with CSM state vector information at required time, scale factor B29, units meters, for use in "COMPDISP" for R31/R34.
$\underline{R}_{\text {sb }}$ : Value of vehicle position vector towards earth computed in "SBANDANT" (initially in reference coordinates, then converted to IMU coordinates), scale factor B29, units meters, stored in push-down list location 2D (subsequently converted to navigation base coordinates). Program notations "R" and "RCM".
$\underline{R}_{t}$ : See Coordinate Transformations.
RANGE: Value of magnitude of vector difference between IM and CSM position vectors computed in "COMPDISP" (for R31/R34), scale factor B29, units meters. Also used to contain out-of-plane position information, same units and scaling, computed in R36. Position information displayed (this cell) in Rl of N53, N54, and N96 (cell also is time-shared with other information).

RAPO: Value of apocenter radius computed in "SR30.1", scale factor B29(earth) or B27(moon), units meters, stored in push-down list location 16D.

RCV: See Orbital Integration.
RHOSB: Value of "pitch angle" computed in "SBANDANT", scale factor BO, units revolutions, in range $-90^{\circ}$ to $+90^{\circ}$. It is displayed in RI of N51.

RLS: See Coordinate Transformations.
RPADTEM: Value of base radius used in R30, scale factor B29(earth, pad radius) or B 27 (moon, landing site radius magnitude), units meters.

RPER: Value of pericenter radius computed in "SR3O.1", scale factor B29(earth) or B27(moon), units meters, stored in push-down list location 14D.

RRATE: Value of component of velocity difference between CSM and LM vehicles (negative if approaching), scale factor B7, units meters/ centi-second. Also used for CSM out-of-plane velocity information for R36, and displayed (with this tag) in R2 of N53, N54, and N96.

RRATE2: Value of LM out-of-plane velocity information computed in R36, scale factor B7, units meters/centi-second, displayed in R3 of N96. Same cell used for e.g. RTHETA.
RSPmRREC: Value of downrange recovery range error (predicted flight central angle minus target central angle, scaled to revolutions), scale factor BO, units revolutions, computed in "DELRSPL" for R30 computations in POO or Pll. Target central angle is computed as an arc cosine in the range between 0 and $\frac{1}{2}\left(0\right.$ and $\left.180^{\circ}\right)$, with no account taken of flight direction. Program notation "RSP-RREC". If TFF is $\geqslant 0$ or -MAX , the predicted flight central angle is considered O. Cell is displayed in Rl of N50 using K (see Noun Definitions).

RTGO: Predicted central angle between the altitude specified by C and splash, scale factor BO, units revolutions, computed in "S61.2". The most significant half is loaded into JJ for telemetry purposes at end of "S61.2".

RTHETA: Display angle information computed for R31 and R34, scale factor BO, units revolutions, displayed in R3 of N53 and N54. Also timeshared with other quantities (such as RRATE2).

SINDELF: Sine of the "transfer angle" between TFRMAG and TFRTERM, scale factor Bl. Computed by the same subroutine as that used for COSDELF.

Tent: Predicted time required to traverse the entry angle PHIE, scale factor B28, units centi-seconds, left in MPAC ${ }_{d p}$ when exit from "AUGEKUGL" routine.
$T_{e t}$ : See Orbital Integration.
$T_{\text {start82: }}$ Value of state vector time tag sampled at start of "V82GOFF1", scale factor B28, units centi-seconds. After complete "SR30.1", is replaced by ( $T_{\text {now }}-T_{\text {start82 }}$ ), or the "age" of the TFF or mTPER value which has been computed. This value is then used to update TFF or mTPER to give a time origin of present time (regardless of the time entered via N16). TFF and mTPER are then updated once a second in "TICKTEST" so as to maintain their status as time from "now" to the specified point.

TFF: Predicted time of free fall to specified altitude (negative if not yet there), scale factor B28, units centi-seconds. It is set to -MAX if trajectory does not intersect the specified altitude (either completely above or completely below it); it is set 0 for indeterminate computation (near perigee for hyperbola or parabola). Updated as discussed for mTPER (if mTPER cell is not updated, of course), for Average-G off (if on, computed on a periodic basis).

TFFIdALF: Value of |semimajor axis| computed in "TFFCONIC", program notation "TFFI/ALF", stored in push-down list location 22D. Scale factor information partially contained in X2; if X2 $=0$, scale factor B22(earth) or B 20 (moon), units meters.

TFFALFA: Value of reciprocal of semimajor axis computed in "TFFCONIC", stored in push-down list location 26D. Scale factor information partially contained in XI; if Xl $=0$, scale factor B-26 (earth) or B-24(moon).

TFFDEN: Value of denominator quantity, stored in push-down list location OD. If TFFQl negative, scale factor Bl6 (earth) or Bl5(moon); if TFFQ1 positive, scale factor B3. Used as numerator in "TFFELL".

TFFdRTMU: Value of reciprocal of square root of mu of primary body, scale factor B-17(earth) or B-14(moon). If loaded in "S61.2", is reciprocal of root mu' (i.e. a mu multiplied by 1.0012, see $K_{\text {ldrtmu }}$ ), provided Cemsalt $n \geqslant e_{290,000} \mathrm{ft}$. Stored in 30D.

TFFNP: Value of semilatus rectum ( p , called LCP, or lower-case p , in comments field) computed in "TFFCONIC", stored in push-down list location 28D. Scale factor information partially contained in XI; if X1 = O, scale factor B38(earth) or B36(moon), units meters.

TFFNUM: Value of numerator quantity, stored in TFFX cell, scale factor B29(earth) or B27(moon) if TFFQ1 negative; scale factor B16(earth) or Bl5(moon) if TFFQl positive. Used as denominator in "TFFELL".

TFFQ1: Intermediate quantity in time-of-flight calculation (function of present state vector), scale factor B16(earth) or B15(moon), stored in push-down list location 14D.

TFFQ2: Intermediate quantity in time-of-flight calculation (function of terminal state vector), scale factor B16(earth) or B15(moon), stored in TFFTEM cell briefly.

TFFRTALF: Square root of |TFFALFA|, computed in "TFFCONIC", stored in pushdown list location 24D. Scale factor information partially contained in X2; if X2 $=0$, scale factor B-10(earth) or B-9(moon).

TFFRZ: Intermediate quantity ("I/Z") computed in "TFFELL", scale factor B-1l(earth) or B-10(moon), stored in TFFTEM cell.

TFFTEM: Cell used for several purposes during the performance of the time-of-flight calculations; when calculation has a normal exit, contains the value of a quantity used in subsequent calculations, with scale factor information partially contained in Xl. If X1 = O, scale factor is B59(earth) or B55(moon).

TFFVSQ: Value of complement of square of velocity divided by mu, computed in "TFFCONIC", scale factor B-20(earth) or B-18(moon).

TFFX: Argument for power series expansion in time-of-flight calculation, scale factor BO, stored in push-down list location 34D.

TFFZ: Intermediate quantity ("Z") computed in case "TFFELL" is not entered, scale factor Bl3(earth) or B12(moon), stored in TFFTEM cell.

TFRMAG: Magnitude of $\underline{R}$ computed in "TFFCONIC" and stored in push-down list location 12D ${ }^{\circ}$ ne "RMAGI", scale factor B29(earth) or B27(moon), units meters. A normalized version, with number of shifts required contained in Xl, is stored in push-down list location 32D with program tag "NRMAG". Distinction in type of value employed is not made in programmed equations description.

TFRTERM: Value of terminal radius used as input argument for time-offlight routines. With scale factor B29(earth) or B27(moon) is stored in push-down list location 18D, tag "RTERM"; shifted left by -XI places (to give same scaling as normalized TFRMAG) is stored in NRTERM, push-down list location 16D. Distinction in type of value employed is not made in programmed equations description.
THETAPR: Value of predicted central angle of travel to target from present location, computed in "DELRSPL", scale factor BO, units revolutions. Program notation "THETA(1)".

TTE: Time from arrival at altitude specified by C B28, units centi-seconds, computed in "S61. 2 msand in "SERVICER" (if 05GSW bit $=0$ ) for N63 display, negative before arrival.

TTEL: Time from arrival at altitude specified by Cemsalt, scale factor B28, units centi-seconds, computed in "S61.2".emsalt is measured from the time contained in $M M$, and is positive before arrival.

TTE2: Complement of the GET at which vehicle will arrive at C emsalt, scale factor B28, units centi-seconds, computed in "S61.2" and usead in "SERVICER" to update TTE.

UNA $_{36}$ : Unit vector computed in R36 perprendicular (i.e. $v * \underline{r}$ ) to the trajectory plane of the CSM (normally the "active" vehicle), scale factor Bl.

UNI: See Entry Computations. Computed in "NEWRNVN" also.
UNP $_{36}$ : Unit vector computed in R36 perpendicular (i.e. $\underline{v} \ldots \underline{r}$ ) to the trajectory plane of the LM (normally the "passive" vehicle), scale factor Bl.

URH: Value of unit terminal position vector computed in "S61.2", scale factor B2.

URONE: Value of unitr ${ }^{\text {one }}$ computed in "NEWRNVN" for use in "S61.2", scale factor Bl.
$\underline{V}_{\text {gbody }}$ : See Burn Control. In "CALCN83" is used to keep cumulative sum of velocity increments in reference coordinates, with DELVIMU being the corresponding information in control coordinates. The notation also "DELVCTL".
$\underline{V}_{g t i g}$ : See Burn Control.
$V_{\text {init }}$ : See Rendezvous Computations. Cell also used as a communication one with "GET.LVC" to define local-vertical coordinate system.
$V_{\text {one }}$ : Velocity vector used to achieve a consistent state vector for use within display computations. Rescaled in "SR30.1" to scale factor B5 if moon centered (otherwise, left at original B7 scaling), units meters/centi-second. See $\underline{R}_{\text {one }}$.
$\underline{V}_{\text {onepr }}$ : Value of $\underline{V}_{\text {one }}$ multiplied by TFFdRTMU in "TFFCONIC", scale factor B-10(earth) or B-9(moon), program notation "VONE'".

V pass36: Value of LM velocity vector computed in R36, scale factor B7,
units meters/centi-second.
V82FLAGS: Single precision cell used to control performance of R30 (initiated by verb 82) if Average-G is off. Initialized to zero in "V82GOFLP" and set to 1 or 2 at end of "V82GOFFI" to signify that mTPER or TFF respectively should be incremented by "TICKTEST": non-zero setting also used in "V82GOFLP" to initiate V16N44 display, since such a setting signifies that data are available for display.

VBARSQ: Value of square of normalized velocity information used to compute GMAX in "S61.2", scale factor B2, stored in push-down list location OD.

VCV: See Orbital Integration.
VIO: Value of predicted velocity at altitude specified by ${ }^{C}$ emsalt, scale factor B7, units meters/centi-second, including ems approximate correction for the drag loss in reaching this altitude (the nominal 0.05 g point).

VMAGI: See Boost Computations.
VPRED: Value of predicted velocity at an altitude of 400,000 feet above Fischer radius computed in "S61.2", scale factor B7, units meters/centi-second. See also Return to Earth Computations.

VTERM: Value of velocity (from vis viva integral) at TFRTERM, scale factor B7(earth) or B5(moon), units meters/centi-second, stored in push-down list location OD (also used as communication cell with "AUGEKUGL").

YAWANG: Cell used in "SBANDANT" to contain value of yaw antenna pointing angle ( $O$ if vectors not defined well), scale factor BO, units revolutions, loaded into GAMMASB for display. YAWANG itself is push-down list location 20D.

## Digital Autopilot Entry Routines

CM/DAPON Entered from "P62"
Set bits 15-14 (DAPBIT1, DAPBIT2) of FLAGWRD6 $=00_{2}$

## Quantities in Computations

See also list of major variables and list of routines

AIG: Value of CDU sampled by "READGYMB", single precision twos complement, scale lactor $\mathrm{B}-1$, units revolutions ("inner gimbal angle").
$A K_{i}(i=0-2):$ See Digital Autopilot Interface Routines.
ALFACOM: Single precision value of commanded "pitch" angle, scale factor B-1, units revolutions. Set to ALFAdl80 in "CM/DAPON", and to Calfapad in "P62.1" (see Entry Preparation).
ALFAd180: See Entry Computations.
AMG: Value of $C^{\text {CDU }}$ sampled by "READGYMB", single precision twos complement, scale factor $B-1$, units revolutions ("middle gimbal angle").

AOG: Value of $C D U_{X}$ sampled by "READGYMB", single precision twos complement, scale factor B-l, units revolutions ("outer gimbal angle").

BETACOM: Single precision value of commanded "yaw" angle, scale factor B-1, units revolutions. Set to BETAdl80 in "CM/DAPON", and to zero in "P62.1".

BETAd180: See Entry Computations.
BETADOT: Single precision value of rate of change of "yaw" angle, scale factor $B-1$, units revolutions/deci-second.

CALFA: Single precision value of cos ALFAdl80, scale factor BO, after ALFAdl80 updated only by QREL ( see "ATTRATES").

CMIDAPMOD: Single precision quantity used to control the performance of the entry DAP. Individual values have the following meanings:

Value

## Significance

-l Bit 3(05GSW) of FLAGWRD6 = 1 (value set in "ATTRATES"). -0 Bit 3(05GSW) of FLAGWRD6 $==0$ and CALFA is at least $\mathrm{K}_{\text {c45im }}$ in magnitude with negative sign (causes damping only, with LCXd360 set to 0). Value set in "EXDAP". +1 Bit 3(05GSW) of FLAGWRD6 $=0$ and CALFA magnitude less than $\mathrm{K}_{\text {c45im }}$. Value set in "EXDAP".
to Bit $3(05 \mathrm{GSW})$ of FLAGWRD6 $=0$ and CALFA at least $\mathrm{K}_{\mathrm{c} 45 \mathrm{im}}$ in magnitude with positive sign. Value set in "EXDAP".

Scale factor is $\mathrm{Bl}_{4}$.

CMdGYMDT: Single precision call time, scale factor B14, units centiseconds, used to permit proper restart time to be set for performance of "READGYMB". Initialized to 5 in "READACCS" (when the base time used for the restart is also set), giving "READGYMB" performance 5 cs out of phase with "READACCS".

CMTMTIME: Value of TIMEI loaded for telemetry purposes in "CM/FDAIR", scale factor B14, units centi-seconds. Cell is the same as UPBUFF+O (see Uplink Processing).

DAPDATRI: See Digital Autopilot Interface Routines.
ENDBUF: Set of cells used for telemetry of (PREL, QREL, RREL), loaded in "CM/FDAIR" on alternate entries to entry DAP (every 0.2 seconds the cell set is loaded). Cell set loaded is indexed by a negative quantity, with ENDBUF-14, ENDBUF-11, etc. used for successive PREL values. ENDBUF-14 is the same cell as UPBUFF+2 (see Uplink Processing).
$\mathrm{ERROR}_{2}$ : See Digital Autopilot RCS Routines (loaded in "EXDAPIN" with the original value of LCXd360 (before sign reversal, if any), for telemetry).

GAMDOT: See Entry Computations.
IMODES33: See IMU Computations.
JETAG: Single precision quantity, scale factor B14, used to control the performance of the entry DAP. The "normal" value is zero; a setting to +1 is made by "SETJTAG" (called every two seconds by "READACCS") to cause an update of roll output to be made.; a setting to -l is made in "EXDAP" if the magnitude of CALFA is less than $\mathrm{K}_{\mathrm{c} 45 \mathrm{im} \text {. }}$

JNDX: Value of jet table index for time interval specified by T scale factor B14. Initialized to -l near start of "EXDAPINNl', and complemented subsequently if necessary. A negative value causes positive jets to be selected by indexing $K_{p r j c d}$. The quantity is single precision.

JNDXl: Single precision quantity, scale factor B14, serving a similar function to JNDX, but for the jets controlled by the time interval specified by. Ton2•
$K_{\text {2jett: }}$ : Single precision constant, program notation "2JETT", scale factor B13, units centi-seconds/entry DAP cycle. Value is $400 \times 2^{-14_{4}}$, corresponding to $200 \times 2^{-13}$, i.e. a two-second entry DAP cycle (for performance of roll command updates).
$K_{2 t d t c d}$ : Single precision constant, program notation "2T/TCDU", scale factor Bl3, units (entry DAP period)/(CDU sample period). Value is $40 \times 2^{-14}$, corresponding to $20 \times 2^{-13}$, i.e. a twosecond entry DAP cycle (to perform roll command updates) and a O.l second CDU sampling period (period of performance of "READGYMB"). Converts angular rates from units of revolutions/ deci-second to revolutions/DAP cycle.
$K_{4 d s i m}$ : Single precision constant, program notation " $4 \mathrm{D} /$ SLIM", scale factor B-l, units revolutions/deci-second. Value is 16348 x $2^{-1 / 4}$, but used in the program in such a way (a check for overflow, i.e. magnitude of 16384 or more, on an argument decremented by l) that the effective value is $(16384-16348+1)$, or 37 least increments, corresponding to $37 \times 180^{\circ} \times 2^{-14} \times 10=4.065^{\circ} / \mathrm{sec}$. The argument is decremented by 1 for convenience in forming the absolute value.
$K_{4 j e t t: ~ S i n g l e ~ p r e c i s i o n ~ c o n s t a n t, ~ p r o g r a m ~ n o t a t i o n ~ " 4 J E T T ", ~ s c a l e ~}^{\text {S }}$ factor B12, units centi-seconds/entry DAP cycle. Value is $800 \times 2^{-11_{t}}$, corresponding to $200 \times 2^{-12}$ (cf. $\left.K_{2 j e t t}\right)$.
$K_{\text {180d8a.tt: }}$ : Single precision constant, program notation "180/8ATT", scale factor B4, units of (revolutions/DAP cycle $\left.{ }^{2}\right)^{-1}$. Nominal value is 0.61813187 , corresponding to the reciprocal of: ( $9.1 \times(1 / 360) \mathrm{x}$ $2^{2} \times 2^{4}$ ), where first term is acceleration (degrees/second ${ }^{2}$ ), second converts to units of revolutions, third converts to units of DAP cycle ${ }^{2}$ ( 2 seconds each), and fourth is scale factor. Actual stored value is about 0.61810. Alternatively, $9.1=2 \times 4.55$.
$K_{\text {c45im }}$ : Single precision constant, program notation "C45LIM", scale factor BO. Value is ll2778 $=4799$, but used in program in such a way (a check for overflow, i.e. a magnitude of 16384 or more, on an argument decremented by $l$ for convenience in forming the absolute value) that effective value is $(16384-4799+1)=$ $11586 \times 2^{-14}=0.707153$, or about $\cos 45^{\circ}$.
$K_{\text {cmdbs }}$ : Single precision constant, program notation "CM/BIAS", scale factor B-l, units revolutions. Value is $55 \times 2^{-14}$, corresponding to about $0.604^{\circ}$.
$K_{\text {costr }}$ : Single precision constant, program notation "COSTRIM", scale factor BO, value 0.93969 , corresponding to cos $\left(-20^{\circ}\right)$.
$K_{k t r c s}:$ Single precision constant, program notation "KTRCS", scale factor $B O$, value 0.5 . Value corresponds to $0.25 \times 2$, where first term is "K"("slope of line determining rate at which error reduced") and second is DAP roll cycle rate of 2 seconds.
$K_{m t m 3}$ : Single precision constant, program notation "1-T-3", scale factor B14, units centi-seconds. Value is $-203 \times 2^{-1 / 4}$, corresponding to -2.03 seconds. See TUSED.
$K_{\text {mvmd }}$ 60k: Single precision constant, program notation "-VM/360K", scale factor BO. Nominal value is -0.22222222 , corresponding to (-1) x $20 \times(1 / 360) \times(1 / 0.25)$, where first term is an equation factor, second is "maximum roll rate limit" (degrees/second), third converts to revolutions, and fourth is reciprocal of "K" (cf. K $\mathrm{K}_{\mathrm{ct}}$ ). Program notation also "-VMT/ 180 ", for which would have scale ktrcso l B-1, units revolutions/DAP cycle, where the " $(1 / 0.25$ )" factor is $2 \times 2^{1}$ (the first factor is two-second cycle, the 2 nd is scale).
$K_{\text {nsec }}$ : Single precision constant, program notation "NSEC", scale factor B14, units centi-seconds. Value is $2100 \times 2^{-14}$, corresponding to 21 seconds. Program comments indicate it is an approximation to the time required to travel $65^{\circ}$ at a rate of $3^{\circ} /$ second.
$K_{\text {prjcd }}$ : Set of three single precision cells, program notation "P/RJCODE", selected by means of an index having values -l, O, +l. Values are:
Index Cell Channel 6 Jets Channel 5 Jets

| -1 | $00005_{8}$ | \#11, \#9 $(+\mathrm{R})$ | \#3, \#1 $(+\mathrm{P})$ |
| ---: | :---: | :---: | :---: |
| 0 | $0000 \mathrm{~g}_{\mathrm{g}}$ | none | none |
| +1 | 00012 g | $\# 10, \# 12(-\mathrm{R})$ | \#2, \#4 $(-\mathrm{P})$ |

$K_{\text {sintr }}$ : Single precision constant, program notation "SINTRIM", scale factor BO, value -0.34202 , corresponding to $\sin \left(-20^{\circ}\right)$. Program comments indicate that this is trim angle for $L / D=0.3$.
$K_{\text {vsqmn }}$ : Single precision constant, program notation "VSQMIN", scale factor Bl, units revolutions. Nominal value is $0.61050061 \mathrm{E}-3$, corresponding to $(2 / 360)^{2} \times(9.1 / 360)^{-1} \times 2^{-2} \times 2^{2} \times 2^{-1}$, where first term is value of the square of "VMMIN" (expressed in units of revolutions), second is acceleration (in revolutions/ second $^{2}$ ), third converts acceleration to DAP cycles (cf. . K ${ }_{\text {l8Odgatt }}$ ), fourth converts VMIN to units of DAP cycles (from rev/sec), and fifth is scale factor. Actual value is about 0.61035E-3, i.e. 00012g.
$K_{x m i n d 360}$ : Single precision constant, program notation "XMTN/360", scale factor BO, units revolutions. Value is $182 \times 2^{-14}$, corresponding approximately to $4 x(1 / 360)$, where first term is value of "XMIN" (degrees), and second converts to revolutions.
$K_{x s d 360}$ : Single precision constant, program notation "XS/360", scale factor $B O$, units revolutions. Value is $91 \times 2^{-14}$, corresponding approximately to $2 \mathrm{x}(1 / 360)$, where first term is value of "X.S" (degrees), and second converts to revolutions. Tag also "BUFLIM".
$K_{\text {yawim: }}$ Single precision constant, program notation "YAWLIM", scale factor yawim ${ }_{B-1}$, units revolutions. Value is $16055 \times 2^{-14}$, but used in the program in such a way (a check for overflow, i.e. a magnitude of 16384 or more, on an argument decremented by 1 for convenience in forming the absolute value) that effective value is (16384$16055+1$ ) $=330$ least increments, corresponding to 330 x (360) $\times 2^{-15}=3.625^{\circ}$.
$\mathrm{K}_{\text {ydtim }}$ : Single precision constant, program notation "YDOTLIM", scale factor B-1, units revolutions/deci-second. Value is 16366 x $2^{-14}$, but used in program in such a way (cf. $K_{L \text { dsim }}$ ) that effective value is 19 least increments, corresponding to about $2.087^{\circ} /$ second.
$K_{y j e t c d}$ : Set of three single precision cells, program notation "YJETCODE", selected by means of an index having values $-1,0,+1$. Values are:

## Index Cell Channel 5 Jets

| -1 | $00120_{8}$ | $\# 7, \# 5(+Y)$ |
| ---: | :---: | :---: |
| 0 | $00000_{8}$ | none |
| +1 | $00240_{8}$ | $\# 6, \# 8(-Y)$ |

LCXd360: Single precision value of roll attitude error (shortest path if LATSW = 1 when enter computations, otherwise an enforced roll over the top) to be corrected, scale factor BO, units revolutions.
mDELAIG: Complement of change in AIG during previous O.l second, scale factor $B-1$, units revolutions/deci-second: is $A I G_{n-1}-$ AIG $_{n}$.
mDELAMG: Complement of change in AMG during previous O.l second, scale factor B-l, units revolutions/deci-second. Notation "-DELAMG".
mDELAOG: Complement of change in AOG during previous O.I second, scale factor $\mathrm{B}-1$, units revolutions/deci-second.
mVTd 180: Complement of value of PREL, converted to units of revolutions/ DAP entry cycle (of 2 seconds). Initially computed with scale factor B-2, and subsequently rescaled to scale factor B-l. Program notation is "-VT/l80". Complemented if point in left half plane.
mVTd 180E: Value of mVTd 180 for telemetry, scale factor B-l, original sign.
NUJET: Single precision cell used to contain the jet pattern to be loaded into channel 6 in "JETCALL2".

OLDELi ( $i=P, Q, R$ ): Previous values of "raw" PREL, QREL, and RREL, scale factor $B-1$, units revolutions/deci-second, used in "BODYRATE" to compensate for angular accelerations. The values used are the uncompensated PREL, QREL, and RREL (i.e. those derived based solely on CDU measurement data this cycle and the previous cycle).

OUTTAG: Single precision quantity, scale factor B14, set to 2 if "JETCALL" performed and to 0 if "JETCALLI" performed, indicating respectively that the exit from "JETCALL2" should be to End of task and to "CM/FDAIR".

P63FLAG: Single precision cell, scale,factor B14, used for control of entry DAP sequencing. It is set to -1 in "CM/DAPON" and in "EXDAP" after "WAKEP62" calling computations initiated. It is set to 1 in "P62.1" after a response to the VO6N6l display, and if 1 is set 0 in "EXDAP" if |CALFAl is less than $K_{\text {cl }}$ im (a 0 value permits "WAKEP62" calling computations). Intended to prevent P63 from starting until response to VO6N6l display, and to avoid more than one "WAKEP62" call. It is set to -l in "P63".
PAXERRI: Single precision quantity, scale factor BO, units revolutions, containing the information to be loaded into $\mathrm{AK}_{\mathrm{O}}$ : during atmospheric entry, it is set to LCXd360 each two seconds, and updated by (CALFA) x (- PHIDOT) each 0.1 second between two-second roll updates.

PHIDOT: Single precision value of rate of change of "roll" angle, scale factor B-1, units revolutions/deci-second. Cos Beta 1 .

PREL: Single precision value of "roll" body angular velocity, scale factor B-l, units revolutions/deci-second. It includes corrections for acceleration and GAMDOT, and is along the "X $X_{b}$ body axis".

QAXERR: Single precision value of pitch attitude error (saved for telemetry purposes), scale factor B-l, units revolutions. It is also used in "EXDAP", and is computed in "ATTRATES".

QREG: Computer single precision Q register (address 0002 ${ }_{8}$ ), used to retain program control information in "DZ1" (zero or non-zero value). After a TC (transfer control) order, Q is loaded with the S-register contents corresponding to the address of the following step (see 3420.5-27).
QREL: Single precision value of "pitch" body angular velocity, scale factor B-l, units revolutions/deci-second (including corrections for acceleration and GAMDOT), measured along the " $\underline{Y}_{b}$ body axis".

RAXERR: Single precision value of yaw attitude error (saved for telemetry purposes), scale factor $B-1$, units revolutions. It is loaded in "EXDAP" and "ATTRATES".
RCSFLAGS: See Digital Autopilot Interface Routines.
ROLLC: See Entry Computations.
ROLIdl80: See Entry Computations.
ROLLHOLD: Single precision value of ROLIdl80 sampled when the entry DAP is started (in "CM/DAPON"), scale factor B-l, units revolutions, and used to provide error signal information for RAXERR in "EXDAP". It is set to 0 in "KEP2", and to ROLLC or ROLLTM in "EXDAPIN"/"DZ1".

ROLLTM: Value of ROLIdl80 placed in a special cell for telemetry purposes, scale factor $B-1$, units revolutions, single precision.

RREL: Single precision value of "yaw" body angular velocity, scale factor $B-1$, units revolutions/deci-second (including corrections for acceleration and GAMDOT), measured along the "Z $\underline{b}_{b}$ body axis".

SALFA: Single precision value of sin ALFAdl80, scale factor BO, after ALFAdl80 updated only by QREL (see "ATTRATES").

SWdNDX: Single precision cell, scale factor Bl4, used for indexing the proper ENDBUF cells to be loaded and to cause alternation in "CM/FDAIR" between update of attitude error needles and loading of ENDBUF. It is set to 1 in "P62" and also in "GETON2", causing ENDBUF to be loaded (after initialization to -13). Negative values cause "NEEDLER" to be performed (by "CM/FDAIR"), and the cell is complemented each entrance to "CM/FDAIR". The cell is the same as UPBUFF+1 (see Uplink Processing).
$T_{\text {off }}$ : Single precision value of time, scale factor $\left.B\right]_{4}$, units centiseconds, required for "drifting" (between firing times of jets specified by $\mathrm{T}_{\mathrm{on}}$ and $\mathrm{T}_{\mathrm{on} 2}$ ). Corresponding "jet pattern" (zero) is in TBITS. Cell set O if no waitlist call is to be made (i.e. if $T_{o n l}$ is small but the $T_{\text {off }}$ value is such that the time delay would expire after the next two-second computing interval); cell set -l if the time interval specified should be ignored (i.e. is too small or has already been used in "JETCALL3" or $\mathrm{T}_{\text {onl }}$ large).
$T_{\text {onl }}$ : Single precision value of time, computed initially with scale factor B2, units DAP roll cycles, and subsequently rescaled to scale factor B14, units centi-seconds (by using $\mathrm{K}_{4}$ jett), giving the required "on time" for the jets in TIBITS. Cell set 0 if no waitlist call to be made ( $T_{o n l}$ of such a size that jets should be left on for the full two-second DAP roll computing interval); cell set to -l if the time interval involved should be ignored (i.e. is too small).
$T_{\text {on2 }}$ : Single precision value of time, same scaling as $T$, giving the required "on time" for the jets in T2BITS. Celliset 0 if no waitlist call is to be made(because delay would expire after the next two-second computing interval); set to -l if the time involved should be ignored (i.e. is too small, if $T_{o n l}+T_{\text {off }}$ is too big, or after being used in "JETCALL3").

TIBITS: Value of jet pattern to be sent for the time duration specified by $T_{\text {onl }}$ (contents loaded into NUJET for transmission via channel 6). These jets are required to go from present phase-planc point to the desired (or maximum) rate, where a coast interval (Toff) takes place and then the T2BITS jets are fired for $T_{\text {on2 }}$ to drive to the origin.

T2BITS: Single precision cell used to contain the value of the jet pattern to be sent for the time duration specified by $T_{\text {on2 }}$ : see discussion of TlBITS.

T5LOC, T6LOC: See Digital Autopilot Interface Routines.
TBITS: Value of the jet "pattern" to be sent for the time interval specified by $T_{o f f}$ : it is set zero in "JETCALLI" (and used for symmetry in the program logic).

TIME5: See Digital Autopilot Interface Routines.
TUSED: Single precision cell, scale factor B14, units centi-seconds, used to keep track of the time elapsed by $T_{o n l}$, $T_{\text {off }}$, and $T$ in order to ensure that waitlist calls will not be set, to elapse after the start of the next computing cycle ( 2 seconds) of the roll entry DAP, and also to make sure that minimum-firing time constraints on the jets are not violated. Cell is set to - TIMEI in "SETJTAG" (about 5 cs , plus computing delays, before the two-second entry roll DAP cycle is performed), and then is set to TIME1 + TUSED (a nominal 5 cs) before the start of processing, with an additional 2(8192) added to compensate, if necessary, for TIMEl overflow. This 5 centi-seconds, plus the two-second cycle, is then subtracted (giving nominally - 200 cs), to which 2 cs is added to avoid problems with the quantization of one cs for the waitlist and the fact that TUSED must exceed 0 for branches in equation logic to be taken: the 5, 200, and 2 are combined into the one constant $K_{m t m 3}$. Additions of $T T_{o n}, T$, and
 a positive non-zero result indicating expiration of the two-second computing interval.

VDTdl80: Single precision cell, scale factor B-1, units revolutions/DAP cycle, giving the velocity argument for use in computing jet on and off times. Can be loaded with either drift velocity, maximum allowable velocity, or present velocity. If in deadzone, is loaded with 0 (for telemetry purposes).

VSQd4API: Single precision cell, scale factor Bl, units revolutions, proportional to square of present "roll" body angular velocity divided by nominal acceleration ( $\mathrm{K}_{180 d 8 a t t}$ mVTdl802).
XDd360: Single precision value of predicted intercept of attitude error axis (rate $=0$ ) by vehicle "trajectory", decremented by $K_{x s d 360}$, scale factor $B O$, units revolutions.

ZREG: Hardware $Z$ register (program counter), which can be used as a convenient source of a positive non-zero number (magnitude not significant). See QREG.

## Digital Autopilot Interface Routines

T6RUPT Entered based on program interrupt \#l, controlled by TIME6 Proceed to address specified by T6LOC

T5RUPT Entered based on program interrupt \#2, controlled by TIME5
If TIME5 $\Rightarrow 50 \mathrm{cs}$, Resume (means TIME5 reset after interrupt was generated)

Proceed to address specified by T5LOC
HANDRUPT Entered based on program interrupt \#l0, controlled by manual controller inputs

Resume

## T5IDLOC

Resume (if entered from TIME5 interrupt, TIME5 will cause an interrupt again in $2^{14}$ centi-seconds)

SETJTAG Called by "READACCS" for entry DAP
TUSED = - TTME1
JETAG = 1
End of task
STABLISH Entered for a V46E
If bits $15-14$ (DAPBIT1, DAPBIT2) of FLAGWRD6 $=10_{2}$ : (TVC DAP)
If bit 14 of DAPDATRI $=1: \quad$ (IM-on)
Perform "SWICHOVR"
Proceed to "PINBRNCH"
Proceed to "ALM/END"
Set bit 9(S4B Takeover Enable) of channel $12=0$
$\mathrm{TS}=$ (bits 14-13 of DAPDATR1, shifted right 12 places) (to bits 2-1)
Inhibit interrupts
If $T S=0_{2}: \quad$ (no DAP)
Perform "ZEROJET"
HOLDFLAG $=1$
(If TS $=\mathrm{OO}_{2}$ ):
T5LOC $=$ "T5IDLOC"
Set bits 15-14 (DAPBIT1, DAPBIT2) of FLAGWRD6 $=0$
Proceed to "PINBRNCH"
If $T S=1 l_{2}$ : (Saturn DAP)
Proceed to "SATSTKON"
Perform "RCSDAPON" (TS $=\mathrm{Ol}_{2}$ or $10_{2}$, for RCS DAP)
Proceed to "PINBRNCH"
DAPDISP Entered for a V48E (this is Routine 03)
If bits $15-14$ (DAPBIT1, DAPBIT2) of FLAGWRD6 $=10_{2}$ : (TVC DAP)
Proceed to "ALM/END"
Perform "TESTXACT"
Establish "DONOUN46" (priority $10_{8}$ )
End of job
DONOUN46
$T S=0446_{\mathrm{vn}}$
Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT"
if proceed, proceed otherwise, proceed to previous line

If bit 4 of DAPDATRI = 1: (maximum deadband specified)
Set bit 12 (MAXDBFLG) of FLAGWRD9 = 1
If bit 4 of DAPDATRI $=0$ :
Set bit 12 (MAXDBFLG) of FLAGWRD9 $=0$ (bit used in "INITSUB")
Perform "S41.2"
$T S=0647 \mathrm{vn}$
Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT" if proceed, proceed otherwise, proceed to previous line

If bits $14-13$ of DAPDATRI $\neq 00_{2}$ : If bits $14-13$ of DAPDATRI $\neq 11_{2}$ :

Inhibit interrupts (DAPDATRI first digit $=1,2,5,6$ )
Perform "MASSPROP"
Release interrupts
Perform "S4O.14"
$T S=0648{ }^{8}$
Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT" if proceed, proceed otherwise, proceed to previous line

Proceed to "ENDEXT"
SETMAXDB
$\mathrm{ADB}=\mathrm{K}_{\text {maxdl }}$
Set bit 4 of DAPDATRI = 1
Return
SETMINDB
THETAD $\underline{X}=\operatorname{CD} \underline{U}$
$A D B=K_{\text {mind }}$
Set bit 4 of DAPDATRI $=0$
Return
STICKCHK (Entered with TS set to control pattern)

```

\(T S=T S+\) LEMMASS
MASS \(=T S\)
Return (to routine calling "MASSPROP" or "FIXCW")

\section*{Quantities in Computations}

See also list of major variables and list of routines
ldCONACC: Single precision value of reciprocal of roll-axis acceleration used for TVC roll DAP, scale factor B9, units of (revolutions/ second \(\left.{ }^{2}\right)^{-1}\). Computed in "S40.15", and is based on two-jet torque (see \(K_{2 p i d m}\) ). Updated every 10 seconds during burm (by entrance to "S40pid \({ }^{\text {dm }}\) ).

ACORBD: Single precision quantity, scale factor Bl4, specifying the quad pair to be used for roll attitude control in the RCS DAP. If positive ( +1 ), quad \(B / D\) is to be used; if negative ( -4096 , for programming convenience), quad \(A / C\) is used. The TVC DAP alternates roll commands between quads. Cell is set in "S41.2" based upon bit 13 of DAPDATR2 (O for positive, I for negative).

ADB: Single precision value of the attitude error deadband used in RCS DAP, scale factor \(B-1\), units revolutions (one least increment is about \(0.011^{\circ}\) ). It is set initially based on bit 4 of DAPDATRI (about \(0.5^{\circ}\) for 0 , about \(5^{\circ}\) for 1), but can subsequently be changed by the program (with changes reflected in DAPDATRI for transfers between "wide" and "narrow" deadbands). In P2O, it is set based on R2 of N79, except that 0 there is interpreted to be \(0.5^{\circ}\), each pass through "R61CSM" (R61CNTR \(=0\) ) or in "R67START". The deadband is restored to the RO3 value (using bit 12 of FLAGWRD9) in "FIXDB" and "INITSUBA". The RO3 value is retained when "DONOUN46" is performed; a noun 01 procedure could also be used to load the cell, if desired.

AK \(\left(\mathrm{AK}_{\mathrm{O}}, \mathrm{AK}_{1}, \mathrm{AK}_{2}\right)\) : Single precision values of attitude errors used as communication cells with "NEEDLFR", scale factor B-1, units revolutions. Nominal scaling of display (see K \({ }_{\text {dacsc }}\) ) is such that "full scale deflection" is \(16.875^{\circ}\) of attitude error, with a positive AK input to "NEEDLER" giving a negative loading of CDUXCMD.

During Pll, entered from "NOPOLYM" with AK loaded so as to give full scale of \(67.5^{\circ}\) (other axes normal scaling), every half second (approximately). Can be used to steer Saturn if control of Saturn switch set. If Saturn DAP activated, entered from "SATSTICK" instead. During RCS DAP operation, "NEEDLER" is entered every 0.2 seconds from "KMATRIX" (on alternate 0.2 seconds, AK is loaded in that routine with appropriate error information).

During TVC DAP operation, "NEEDLER" is entered every 0.5 second from "TVCEXEC", with AK loaded by "TVCEXEC", "PCOPY", and "YCOPY" respectively.

During entry DAP operation, "NEEDIER" is entered from "CM/FDAIR" every 0.2 second, with \(\mathrm{AK}_{0}\) loaded so as to give full scale of \(67.5^{\circ}\) and others having normal scaling. \(A K O\) is set 0 every 2 seconds if CMDAPMOD \(=-0\) (see Digital Autopilot Entry Routines), and \(A K_{1}\) and \(A K_{2}\) effectively set 0 if bit 3 (O5GSW) of FLAGWRD6 = 1! they are otherwise computed in "ATTRATES" and "EXDAP" respectively.

The general polarity of loading \(A K\) is "commanded angle minus present angle". A DSKY one-shot drive of error needles can be done by V43E means (from "ATTCKI").

CDUXCMD: See IMU Computations. If coarse align bit is not set, the data goes to FDAI attitude error display ( \(x\), y, z associated with roll, pitch, and yaw respectively, with 384 pulses giving full scale deflection). If bit 9 of channel \(12=1\), the information in the cells is used for Saturn control.

CNTR: Single precision cell used for switch-over control purposes in TVC DAP. Prior to entering TVC DAP, is used in "S40.6" as a flag to indicate whether that routine entered from "PRE40.6" (value 1, scale factor B14) or from "P4OSXTY" (value +0). If it was entered from "PRE4O.6", then the four-second delay before driving the SPS gimbals to their trim position is bypassed.

CSMMASS: Value of CSM mass, scale factor Bl6, units kilograms, computed double precision in "S40.8" but used single precision elsewhere (including DSKY loading). Since the least significant half is not otherwise employed, the displayed value can differ from the onboard estimate by \(\ddagger_{\sim} 4 \mathrm{~kg}\) (about 8.8 pounds). It can be loaded manually in Rl of N47, and is updated in "S4O.8". The updating consists of subtracting two seconds worth of mass flow rate (determined by a pad-load constant in units of kilograms/centi-second) if the sensed accelerometer output in the previous two-second interval exceeded the thrust-fail criterion (another pad-load constant). The updating occurs whenever "S40.8" is entered (and the accelerometer output is sufficient), and uses MASSTMP (see "S40.8") for restart protection purposes. "S40.8" is entered only for P40, starting when Average-G is turned on (due to AVEGEXIT setting in "P4OSXTY"), and ending when AVEGEXIT is loaded with some other quantity (e.g. "CALCN85" in "P4ORCS" for an ENTR to F V99 or PRO to F V16 N4O after the burn). Because of this logic, no other special provisions need be made to compensate for thrust fail conditions: it should be noted, however, that the gain updates in "TVCEXEC" are based on the current value of CSMMASS. Although the mass updating is done as part of the Average-G computation loop, the computations are entered only in P4O. As a result, if an SPS burn were to be done using the SCS and P47, for example, CSMMASS would have to be updated manually.

DAPDATRI: Single precision quantity whose individual octal digits are assigned control significance for the RCS and TVC DAPs, and which is displayed in Rl of N46. Digit \#l is used for the TVC DAP to determine vehicle configuration (IM-off, LM-on descent \& ascent, or LM-on ascent only), while the remaining digits are used only by the RCS DAP (together with digit \#1). Digits \#2 - \#5 are processed in "S4l.2", which is entered when RO3 is performed as well as when the RCS DAP is initialized (e.g. after a restart or when IMU data becomes usable after a period of not being usable). The individual bits of DAPDATRl have the following meanings(digit \#l is also referred to as "A", \#2 as "B", etc.):
\begin{tabular}{|c|c|c|}
\hline \begin{tabular}{l}
Octal \\
Digit
\end{tabular} & Word Bit & Significance \\
\hline 1 & 15-13 & \begin{tabular}{l}
Specify vehicle configuration/desired DAP. \\
Because of the use of various bits (e.g. 14 and 13) at different parts of the program to obtain vehicle information, caution should be used that the digits specified be those below, and other patterns should be avoided. \\
0 is set by "CM/DAPON" for entry DAP, and terminates other DAP activity if "STABLISH" is entered \\
1 indicates LM-off (causes RCS DAP to be started if "STABLISH" is entered) \\
2 indicates LM-on ascent and descent, and causes RCS DAP to be started if "STABLISH" is entered \\
3 indicates Saturn DAP, and causes Saturn DAP to be started if "STABLISH" is entered \\
6 indicates LM-on ascent only, and causes RCS DAP to be started if "STABLISH" is entered (bit 15 is used in "MASSPROP" to select proper coefficient values)
\end{tabular} \\
\hline 2 & \[
\begin{gathered}
12-11 \\
10
\end{gathered}
\] & \begin{tabular}{l}
Not used (no effect) \\
Allow use of quad A/C for X-translation if 1
\end{tabular} \\
\hline 3 & \[
\begin{gathered}
9-8 \\
7
\end{gathered}
\] & \begin{tabular}{l}
Not used (no effect) \\
Allow use of quad \(B / D\) for \(X\)-translation if 1 \\
(if bits 10 and 7 both 0, program acts as if both bits were 1)
\end{tabular} \\
\hline 4 & \[
\begin{gathered}
6-5 \\
4
\end{gathered}
\] & \begin{tabular}{l}
Not used (no effect) \\
Select narrow deadband ( \(0.5^{\circ}\) ) if 0 and wide deadband ( \(5.0^{\circ}\) ) if 1 : loading of ADB is done
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{ccc}
\begin{tabular}{l} 
Octal \\
Digit
\end{tabular} & \begin{tabular}{c} 
Word \\
Bit
\end{tabular} & Significance \\
5 & 3 & \begin{tabular}{l} 
Not used (no effect) \\
Specify maneuver rate for RHC or automatic \\
maneuvers:
\end{tabular} \\
& & 002 for \(0.05^{\circ} / \mathrm{sec}\) \\
& & \(01_{2}^{2}\) for \(0.20^{\circ} / \mathrm{sec}\) \\
& & \(11_{2}^{2}\) for \(0.50^{\circ} / \mathrm{sec}\) \\
& & \(2.00^{\circ} / \mathrm{sec}\)
\end{tabular}

DAPDATR2: Single precision quantity whose individual octal digits are assigned control significance for the RCS DAP only, and which is displayed in R2 of N46. It is processed in "S41.2", with the individual bits having the meanings given below:

Octal Word
Digit Bit
15-14 Not used (no effect)
13 Use quad \(A / C\) for roll if 1 (if 0 , use \(B / D\) )
12-11 Not used (no effect)
10
9-8 Not used (no effect)
7 Quad B may be used if 1 (not to be used if 0)
4 6-5 Not used (no effect)
4 Quad C may be used if l (if bit 10 is l, quad C not to be used if bit 4 is 0 )

5 3-2 Not used (no effect)
1 Quad D may be used if 1 (if bit 7 is 1 , quad \(D\) not to be used if bit 1 is 0 )

DELCMWT: Value of (CSMMASS \(+K_{\text {negbpw }}\) ) computed in "FIXCW", scale factor B15, units kilograms, single precision (the difference between present CSM mass and the "breakpoint" value for use in computing mass-property information). Program notation is "TEMP333".

DELPBAR, DELYBAR: See Digital Autopilot TVC Routines.
EDRIVE: Single precision values of previous scaled AK output information in "NEEDLES", scale factor B14, units output drive pulses (there are \(2^{13}\) pulses per revolution for standard scaling). EDRIVE is the internal computer image of the number contained in the appropriate error counter driven from CDUXCMD, and is required since interface is incremental pulses from a previous setting.

HOLDFLAG: Single precision quantity, scale factor B14, used to control the nature of the attitude hold performed by the RCS DAP. A positive non-zero value means that at the next opportunity ("AHFNOROT" entered not in Free Mode and with rate filter initialized), the present CDU angles should be loaded into THETADX for use as the new attitude reference. A +0 value means that the DAP is in attitude hold about the angles in THETADX. A negative non-zero value means that automatic maneuvers are being performed (and WBODY, CDUXD, BIAS, and DELCDU all have an effect, see Digital Autopilot RCS Routines).
A positive non-zero value is loaded if the DAP's control of the vehicle is removed (e.g. bit 15 of channel \(31=1\) ); when the DAP is initialized; if the IMU data is not usable (i.e. not fine align) ; if the Free Mode is entered; if RHC commands are provided; or if no DAP is desired (by "STABLISH"). If HOLDFLAG is negative nonzero and a switch to Hold Mode is made, attitude hold is also performed (same effect as having HOLDFLAG positive non-zero, although the setting is not made).
A positive zero value is set in "AHFNOROT" after loading THETADX provided that bits \(13-11\) of RCSFLAGS \(=0\) (i.e. damping done), and in "T5PHASE2" if the magnitude of the middle gimbal angle exceeds \(75^{\circ}\). A negative non-zero value is set in R61 and also when attitude maneuver computations (e.g. R60 or R67) have loaded the DAP interface cells. Programs checking HOLDFLAG can conclude, if it is not negative non-zero, that an interruption of the automatic maneuver has occurred.

IAVG: Single precision value of the "average" of moments of inertia about the \(y\) and \(z\) axes, scale factor B2O, units kilogram-meters \({ }^{2}\). It is computed as a function of CSMMASS (and LEMMASS if DAPDATRI so indicates) in "FIXCW" and is used in "S40.14" to compute quantities for the RCS DAP (the separate quantity IAVGdTLX is used for the TVC DAP). Storage address corresponds to "IXX" +1.

IAVGdTLX: Single precision value of the "average" of moments of inertia about the \(y\) and \(z\) axes divided by the "thrust moment" (product of engine thrust and the "moment arm from hinge-point to c.g."), scale factor B2, units seconds \({ }^{2}\), used in "S40.15" to multiply KTLXdI to obtain VARK. Program notation is "IAVG/TLX", and storage address corresponds to "IXX" +2. Computed in "FIXCW".

IXX: Single precision value of moment of inertia about the x axis (roll), scale factor B2O, units kilogram-meters \({ }^{2}\), computed in "FIXCW". It is used in "S40.14" and "S40.15" to compute quantities for the RCS and IVC DAPs respectively.

JdM ( \(\mathrm{JdM}_{0}, \mathrm{JdM}_{1}, \mathrm{JdM}_{2}\) ): Single precision value of \(80 \%\) of the reciprocal of one-jet acceleration about roll, pitch, and yaw axes respectively, scale factor B23, units of (revolutions/(deci-second centi-second)) \({ }^{-1}\), so that multiplication of a rate in revolutions/deci-second by JdM yields a time in centi-seconds. The \(80 \%\) factor is in \(K\) account for "tolerances in the torque produced by the jentonand uncertainties in the vehicle moment of inertia". The quantities are computed in "S40.14", with pitch and yaw values the same.

JETAG: See Digital Autopilot Entry Routines.
\(K_{2 p i d m}\) : Single precision constant, program notation " \(2 \mathrm{PI} / \mathrm{M}^{\prime \prime}\), scale factor B-8. Nominal value is \(0.00331017 \times 2^{8}\), corresponding to the reciprocal of: ( \(\left.700 \times 2 \times 1.355817948 \times(1 / 2 \pi) \times 2^{-8}\right)\), where first term is nominal torque due to a single jet (in footpounds), second accounts for two jets, third converts to units of newton-meters, fourth converts to units of revolutions, and fifth is scale factor.
\(K_{\text {cntone }}\) : Single precision constant, program notation "CONTONE", scale factor B3, value 0.662034 . Value corresponds to the reciprocal of: ( \(\left.700 \times 1.355817948 \times(1 / 2 \pi) \times(1 / 0.8) \times 10^{-2} \times 10^{-1} \times 2^{3}\right)\), where first term is nominal torque due to single jet (in footpounds), second converts to units of newton-meters, third converts to units of revolutions, fourth is the \(80 \%\) factor discussed for JdM, fifth converts to units of centi-seconds for result, sixth converts rotation rate to units of deci-seconds (see JdM for the time units), and seventh is the scale factor.
\(K_{\text {cnttwo }}\) : Constant, program notation "CONTTWO", scale factor B7, value \({ }^{\text {cnttwo }} 0.00118\) (double precision). Value corresponds to 700 x \(1.355817948 \times(1 / 2 \pi) \times 10^{-1} \times 10^{-2} \times 2^{-7}\), where first term is nominal torque due to single jet (in foot-pounds), second converts to units of newton-meters, third converts to units of revolutions, fourth converts to deci-seconds (for rotation rate), fifth converts to centi-seconds (see KMJ for time units), and sixth is scale factor.
\(\mathrm{K}_{\text {dacmit }}\) : Single precision constant, program notation "DACLIMITT+1", scale corresponding to 384 pulses (the saturated error counter). Actual program implementation involves 3 constants: -384, 16000, and +384 , with the 16000 used as a magnitude check. If, when 16000 is added to magnitude of argument, the answer overflows (exceeds 16383), then limiting is required. The 384 corresponds to \(600_{8}\).
\(K_{\text {dacsc }}\) : Single precision constant, program notation "QUARTER" \({ }^{2}\) scale factor Bl5, value \(\frac{1}{4}\), corresponding to a true value of \(2^{13}\). It converts AK from units of revolutions to units of output drive pulses, with \(2^{13}\) pulses corresponding to the nominal scaling for a revolution. Hence 384 pulses, the error counter saturation level, correspond to \(167 / 8\) degrees, as discussed for AK.
\(K_{\text {dc46 }}\) : Single precision constant, program notation "DEC46", scale factor \(B-1\), units revolutions. Value is \(46 \times 2^{-14}\), the same as \(K_{\text {mindb }}\).
\(\mathrm{K}_{\mathrm{dc}} \mathrm{OO}^{\text {: }}\) Single precision constant, program notation "DEC409", scale factor B-1, units revolutions. Value is \(409 \times 2^{-14}\), which when added to \(K_{\mathrm{dc} 46}\) gives \(455 \times 2^{-14}\), the same as \(\mathrm{K}_{\text {maxdb }}\) •
\(K_{\text {dxitfix: }}\) : Single precision constant, program notation "DXITFIX", scale factor \(\mathrm{B}-12\), units seconds \({ }^{2} /\) kilogram, used to increment VARST' 7 if LM-on APS-only configuration is specified. Nominal value is \(-1.88275 \mathrm{E}-5 \times 2^{12}\), corresponding to \(-0.854 \mathrm{E}-5 \mathrm{x}^{\mathrm{x}}\) (1/0.45359237) \(\times 2^{12}\), where first term is value in \(\sec ^{2} /\) pound, second converts to kilograms, and third is scale factor. Octal value is \(75420_{8}\), corresponding to about \(-0.85367 \mathrm{E}-5 \mathrm{sec}^{2} /\) pound.
\(K_{\text {intvalue }}\) : Single precision constant, program notation "INTVALUE", 0 scale factor B2O, units kilogram-meters \({ }^{2}\), used as the constant value to initialize VARSTO for LM-on. Nominal value is \(26850 \times 2^{-20}\), corresponding to about 19803.5 \(\times 1.355817948\) \(\times 2^{-20}\), where first term is value in slug-ft \({ }^{2}\), second converts to kilogram-meters \({ }^{2}\), and third is scale factor. Octal value is 00644 , corresponding to 26880 kilogram-meters \({ }^{2}\) or about 19826 slug-ft \({ }^{2}\).
\(K_{\text {intvalue }}\) : Single precision constant, program notation "INTVALUE +1", 1 scale factor B2O, units kilogram-meters \({ }^{2}\), used as the constant value to initialize VARSTl for LM-on (if descent stage off, subsequently incremented by VARST8). Nominal value is \(127518 \times 2^{-20}\), corresponding to about \(94052.5 \times 1.355817948 \times\) \(2^{-20}\), where first term is value in slug-ft \({ }^{2}\). Octal value is 3710 , corresponding to 127488 kilogram-meters \({ }^{2}\) or about 94038 slug-ft \({ }^{2}\).
\(K_{i n t v a l u e}\) : Single precision constant, program notation "INTVALUE +2", 2 scale factor B2, used to initialize VARST2 for LM-on (if descent stage off, subsequently incremented by VARST8) by providing the constant value, Nominal value is \(0.54059 \times 2^{-2}\), corresponding to 0.54059 seconds \(^{2}\) (since units of constant are seconds\({ }^{2}\) ). Octal value is 4246 , corresponding to about 0.540527 seconds \({ }^{2}\).
\(K_{\text {intvalue }}^{3}\) : Single precision constant, program notation "INTVALUE +3 ", 3 scale factor B-12, used to initialize VARST3 for LM-on, by providing the constant value. Nominal value is \(0.153964 \mathrm{E}-4 \times 2^{12}\), with units seconds \({ }^{2} /\) kilogram. Nominal yalue corresponds to about \(0.698369 \mathrm{E}-5 \times(1 / 0.45359237) \times 2^{12}\), where first term is value in seconds \({ }^{2} /\) pound, second converts to kilograms, and third is scale factor. Octal value is \(201 l_{g}\), corresponding to about \(0.698210 \mathrm{E}-5\) seconds \({ }^{2} /\) pound.
\(K_{\text {intvalue }}\) : Single precision constant, program notation "INTVALUE +4 ", 4 scale factor B6, used to initialize VARST4 for LM-on, by providing the constant value, units (kilogram-meters \({ }^{2}\) )/kilogram. Nominal value is \(-0.742923 \times 2^{-6}\), corresponding to about -0.2485468 x \(1.355817948 \times(1 / 0.45359237) \times 2^{-6}\), where first term is value in slug-ft \({ }^{2}\) /pound, second converts to kilogram-meters \({ }^{2}\), third converts to kilograms, and fourth is scale factor. Octal value is \(77501_{8}\), corresponding to about -0.24830 slug- \(\mathrm{ft}^{2} /\) pound.
\(K_{\text {intvalue }}^{5}\) : Single precision constant, program notation "INTVALUE +5",
5 scale factor B6, used to initialize VARST5 for LM-on, by providing the constant value units (kilogram-meters \({ }^{2}\) )/kilogram. Nominal value is \(1.5398 \times 2^{-6}\), corresponding to about \(0.51514 \times\) \(1.355817948 \times(1 / 0.45359237) \times 2^{-6}\), where first term is value in slug-ft \({ }^{2} /\) pound 2 Octal value is 612 , corresponding to about 0.5149 slug-ft \(\mathrm{f}^{2} /\) pound. Octal value same as \(\mathrm{K}_{\text {nolemval }}^{5}\).
\(K_{\text {intvalue }}\) : Single precision constant, program notation "INTVALUE +6 ", providing the constant value, units (kilogram-meters \({ }^{2}\) )/kilogram. Nominal value is \(9.68 \times 2^{-6}\), corresponding to about 3.2385 x \(1.355817948 \times(1 / 0.45359237) \times 2^{-6}\), where first term is value in slug-ft \({ }^{2}\) /pound, Octal value is 4656 , corresponding to about 3.2384 slug-ft \(2 /\) pound.
\(K_{\text {intvalue }_{r}}\) : Single precision constant, program notation "INTVALUE + 7 ", scale factor B-12, used to initialize VARSTY for LM-on, by providing the constant value, units seconds \({ }^{2} /\) kilogram. Nominal value is \(0.647625 \mathrm{E}-4 \times 2^{12}\), corresponding to about \(0.293758 \mathrm{E}-4\) \(\times\) (1/0.45359237) \(\times 2^{12}\), where first term is value in \(\mathrm{sec}^{2} /\) pound, second converts to kilograms, and third is scale factor. Octal value is 10372 , corresponding to about \(0.293748 \mathrm{E}-4 \mathrm{sec}^{2} /\) pound.
\(K_{\text {intvalue }}^{8}\) : Single precision constant, program notation "INTVALUE +8 ", providing the constant value, units kilogram-meters \({ }^{2}\). Nominal value is \(-27228 \times 2^{-20}\), corresponding to about - 20082 x \(1.355817948 \times 2^{-20}\), where first term is value in slug-ft \({ }^{2}\), second converts to kilogram-meters \({ }^{2}\), and third is scale factor, Octal value is \(77126_{8}\), corresponding to -27200 kilogram-meters \({ }^{2}\) or about -20062 slug \(-\mathrm{ft}^{2}\).
\(K_{\text {intvalue }}^{9}\) : Single precision constant, program notation "INTVALUE +9", providing the constant value, units seconds \({ }^{2}\). Nominal value is \(-0.206476 \times 2^{-2}\), corresponding to -0.206476 seconds \({ }^{2}\). Octal value of constant is \({ }^{76261} 1_{8}\), corresponding to about -0.206543 seconds \({ }^{2}\).
\(K_{\text {mactdg }}\) : Single precision constant, program notation "- 4 ACTDEG", scale
m4actdg factor B14, units CDU actuator output pulses (one pulse is 85.41 seconds; there are about 42.14963 pulses/degree). Value is \(-168 \times 2^{-14}\), or twice the value of \(K_{p}\) pactdg (with opposite sign),
\(\mathrm{K}_{\text {maxdb }}\) : Single precision constant, program notation "MAXDB", scale factor B-1, units revolutions. Value is \(455 \times 2^{-14}\), corresponding to about 4.9988 degrees.
\(K_{\text {mindb }}\) : Single precision constant, program notation "MINDB", scale factor B-1, units revolutions. Value is \(46 \times 2^{-14}\), corresponding to about 0.5054 degrees.
\(K_{n e g b p w}\) : Single precision constant, program notation "NEGBPW", scale factor B16, units kilograms, giving the complement of the CSM "breakpoint" weight for computation of mass properties. Nominal value is \(-15402.17 \times 2^{-16}\), corresponding to -15402.17 kilograms or about 33955.97 pounds (program comments indicate that "dry weight" is 23956 pounds, giving effect for constant of 10,000 pounds of propellant). Octal value is 70364 , corresponding to -15404 kilograms ( -33960.0 pounds).
\(K_{\text {nolemval }}\) : Single precision constant, program notation "NOLEMVAL", for VARSTO for LM-off. Nominal value is \(25445 \times 2^{-20}\), corresponding to about \(18767 \times 1.355817948 \times 2^{-20}\), where first term is value in slug-ft \({ }^{2}\), second converts to kilogram-meters \({ }^{2}\), and third is scale factor. Octal value is \(616_{8}\), corresponding to about 18787 slug- \(\mathrm{ft}^{2}\).
\(K_{\text {nolemval }}\) : Single precision constant, program notation "NOLEMVAL +1", 1 scale factor B2O, units kilogram-meters \({ }^{2}\), used to give setting for VARSTI for LM-off. Nominal value ish \(87450 \times 2^{-20}\), corresponding to about \(64500 \times 1.355817948 \times 2^{-20}\), where first term is value in slug-ft \({ }^{2}\). Octal value is 2526 g, corresponding to about 64481 slug-ft \({ }^{2}\).
\(K_{\text {nolemval }}^{2}\) : Single precision constant, program notation "NOLEMVAL +2", scale factor B2, used to give setting for VARSTZ for LMoff, units seconds \({ }^{2}\). Nominal value is \(0.30715 \times 2^{-2}\), corresponding to 0.30715 seconds \({ }^{2}\). Octal value is 2352 , corresponding to about 0.30713 seconds \({ }^{2}\).
\(K_{\text {nolemval }}\) : Single precision constant, program notation "NOLEMVAL +3", 3 scale factor \(B-12\), units seconds \({ }^{2} /\) kilogram, used to initialize VARST3 for LM-off. Nominal value is \(1.22877 \mathrm{E}-5 \times 212\), corresponding to \(0.55736 \mathrm{E}-5 \times(1 / 0.45359237) \times 2^{12}\), where first term is value in seconds \({ }^{2} /\) pound, second converts to kilograms, and third is scale factor. Octal value is \(147 l_{8}\), corresponding to about \(0.55762 \mathrm{E}-5\) seconds \({ }^{2} /\) pound.
\(K_{\text {nolemval }}^{4}\) : Single precision constant, program notation "NOIEMVAL +4 ", 4 scale factor B6, used to initialize VARST4 for LM-off, units kilogram-meters \({ }^{2}\) per kilogram. Nominal value is 1.6096 x \(2^{-6}\), corresponding to about \(0.5385 \times 1.355817948 \times(1 / 0.45359237\) ) \(\times 2^{-6}\), where first term is value in slug-ft \({ }^{2}\) /pound, second converts to kilogram-meters \({ }^{2}\), third converts to kilograms, and fourth is scale factor. Octal value is 634 , corresponding to about 0.53842 slug-ft \({ }^{2} /\) pound.
\(K_{\text {nolemval }}^{5}\) : Single precision constant, program notation "NOIEMVAL +5 ", units kilogram-meters \({ }^{2}\) per kilogram. Nominal value is 1.54 x \(2^{-6}\), corresponding to about \(0.5152 \times 1.355817948 \times(1 / 0.45359237)\) x \(2^{-6}\), where first term is value in slug-ft \({ }^{2} /\) pound, second converts to kilogram-meters \({ }^{2}\), third converts to kilograms, and fourth is scale factor. Octal value is \(612_{8}\), corresponding to about 0.5149 slug-ft \({ }^{2} /\) pound. Octal value same as \(K_{\text {intvalue }}^{5}\).
\(K_{n o l e m v a l}\) : Single precision constant, program notation "NOIEMVAL +6", nolemval 6 scale factor \(\mathrm{BC}_{3}\) used to initialize VARST6 for LM-off, units kilogram-meters \({ }^{2}\) per kilogram. Nominal value is \(7.77177 \times 2^{-6}\), corresponding to about \(2.600 \times 1.355817948 \times\) ( \(1 / 0.45359237\) ) \(\times 2^{-6}\), where first term is value in slug-ft \({ }^{2} /\) pound, second converts to kilogram-meters \({ }^{2}\), third converts to kilograms, and fourth is scale factor. Octal value is 3706 , corresponding to about 2.6006 slug- \(\mathrm{ft}^{2} /\) pound.
\(K_{\text {nolemval }}^{r}\) : Single precision constant, program notation "NOLEMVAL + 7 ", units seconds \({ }^{2} /\) kilogram. Nominal value is \(3.46458 \mathrm{E}-5 \times 2^{12}\), corresponding to about \(1.5715 \mathrm{E}-5 \times(1 / 0.45359237) \times 2^{12}\), where first term is value in \(\mathrm{sec}^{2} /\) pound, second converts to kilograms, and third is scale factor. Octal value is 4425 , corresponding to about \(1.57148 \mathrm{E}-5 \mathrm{sec}^{2} /\) pound.
\(K_{\text {nolemval }}^{8}\) : Single precision constant loaded into VARST\& for LM-off, 8 but should not be used. Cell corresponds to \(\mathrm{K}_{\text {intvalue }}\),
same scaling. with same scaling.
\(K_{\text {nolemval }}^{9}\) : Single precision constant loaded into VARST' for LM-off, 9 but should not be used. Cell corresponds to \(K_{\text {intivalue }}^{1}\)
with octal number considered scaled B2 instead \({ }_{\text {OI }}\), but with octal number considered scaled B2
B20. Value would be about 0.48633 seconds \({ }^{2}\).
\(K_{\text {p2actdg }}\) : Single precision constant, program notation "+2ACTDEG", scale factor \(B 14\), units CDU actuator pulses (see \(K_{\text {m }}\) actdg) Value is \(84 \times 2^{-14}\), corresponding to about +2 degrees.
\(K_{\text {slopeval }}\) : Single precision constant, program notation "SLOPEVAL", as the slope value to initialize VARSTO for LM-on. Nominal value is \(1.96307 \times 2^{-6}\), corresponding to about \(0.65675 \times 1.355817948\) x (1/0.45359237)'x \(2^{-6}\), where first term is value in slug-ft \({ }^{2} /\) pound, second converts to kilogram-meters \({ }^{2}\), third converts to kilograms, and fourth is scale factor. Octal value is 767, corresponding to about 0.65734 slug-ft \(2 /\) pound.
\(K_{\text {slopeval }}\) : Single precision constant, program notation "SLOPEVAL +1", slopeval \(_{1}\) scale factor B6, units kilogram-meters \({ }^{2} /\) kilogram, used as the slope value to initialize VARSTl for LM-on. Nominal value is \(27.5774 \times 2^{-6}\), corresponding to about \(9.2261 \times 1.355817948 \times\) ( \(1 / 0.45359237\) ) \(\times 2^{-6}\), where first term is value in slug-ft \(2 /\) pound. Octal value is 15624 , corresponding to about 9.2263 slug-ft \({ }^{2} /\) pound.
\(K_{\text {slopeval }}^{2}\) : Single precision constant, program notation "SLOPEVAL +2 ", slope value to initialize VARST2 for LM-on. Nominal value is \(2.3548 \mathrm{E}-5 \times 2^{12}\), corresponding to about \(1.06812 \mathrm{E}-5 \times(1 / 0.45359237)\) \(\times 2^{12}\), where first term is value in seconds \({ }^{2} /\) pound, second converts to kilograms, and third is scale factor. Octal value is 3054 , corresponding to about l.06793E-5 seconds \({ }^{2} /\) pound.
\(K_{\text {slopeval }}\) : Single precision constant, program notation "SLOPEVAL +3 ", slopeval \(_{3}\) : scale factor \(\mathrm{B}-26\), units seconds \({ }^{2} / \mathrm{kilogram}\) per kilogram, used as the slope value to initialize VARST3 for LM-on. Nominal value is \(2.1777 \mathrm{E}-9 \times 2^{26}\), corresponding to about \(0.44805 \mathrm{E}-9 \mathrm{x}^{\mathrm{x}}\) \((1 / 0.45359237)^{2} \times 2^{26}\), where first term is value in seconds \({ }^{2} /\) pound per pound. Octal value is 4532 g, corresponding to about \(0.44798 \mathrm{E}-9\) seconds \({ }^{2}\) /pound per pound. \(K_{\text {slopeval }}^{4}\) : Scale factor B-8, units kilogram-meters \({ }^{2}\) per kilogram per \({ }^{\text {s }}\), kilogram, used as the slope value to initialize VARST4 for LM-on. Nominal value is \(1.044 \mathrm{E}-3 \times 2^{8}\) corresponding to about \(0.1584 \mathrm{E}-3\) \(\times 1.355817948 \times(1 / 0.45359237)^{2} \times 2^{8}\), where first term is value in slug-ft \(2 /\) pound per pound, second converts to kilogram-meters \({ }^{2}\), third converts to kilograms, and fourth is scale factor. Octal value is 10433 , corresponding to about \(0.158433 \mathrm{E}-3\) slug-ft \({ }^{2} /\) pound per pound.
\(\mathrm{K}_{\text {slopeval }}{ }_{5}\) : Single precision constant, program notation "SLOPEVAL +5 ", kilogram, used as the slope value to initialize VARST5 for LM-on. Value is zero, meaning that VARST5 is not affected by LEMMASS.
\(K_{\text {slopeval }}\) : Single precision constant, program notation "SLOPEVAL +6",
slopeval 6 scale factor B-8, units kilogram-meters \({ }^{2}\) per kilogram per kilogram, used as the slope value to initialize VARST6 for LM-on. Nominal value is 2.21068 E-3 \(\times 2^{8}\), corresponding to about \(0.335472 \mathrm{E}-3 \times 1.355817948 \times\left(1 / 0^{0} .45359237\right)^{2} \times 2^{8}\), where first term is value in slug-ft \({ }^{2}\) /pound per pound. Octal value is \(22070_{8}\), corresponding to about \(0.33546 \mathrm{E}-3\) slug- \(\mathrm{ft}^{2} /\) pound per pound.
\(K_{\text {slopeval }}\) : Single precision constant, program notation "SLOPEVAL + 7 ", slopeval \({ }_{7}\) scale factor B-26, units seconds \(2 /\) kilogram per kilogram, used as the slope value to initialize VARST7 for LM-on. Nominal value is \(1.5166 \mathrm{E}-9 \times 2^{26}\), corresponding to about \(0.31203 \mathrm{E}-9 \mathrm{x}\) \((1 / 0.45359237)^{2} \times 2^{26}\), where first term is value in seconds \({ }^{2} /\) pound per pound, second converts to kilograms, and third is scale factor. Octal value is 3204 , corresponding to about \(0.31212 \mathrm{E}-9\) seconds \({ }^{2} /\) pound per pound.
\(K_{\text {slopeval }}^{8}\) : Single precision constant, program notation "SLOPEVAL +8 ", as the slope value to initialize VARST8 for LM-on. Nominal value is \(-1.284 \times 2^{-6}\), corresponding to about-0.4296 \(\times 1.355817948 \times\) (1/0.45359237) x \(2^{-6}\), where first term is value in slug-ft2/pound, second converts to kilogram-meters \({ }^{2}\), third converts to kilograms, and fourth is scale factor. Octal value is \(77266_{8}\), corresponding to about -0.4300 slug-ft \(2 /\) pound.
\(K_{\text {slopeval }}\) : Single precision constant, program notation "SLOPEVAL +9", sale factor B-12, units seconds \(/\) kilogram, used as the slope value to initialize VARST9 for LM-on. Nominal value is \(2.00 \mathrm{E}-5 \times 2^{12}\), corresponding to about \(0.9072 \mathrm{E}-5 \times(1 / 0.45359237\) ) \(\mathrm{x} 2^{12}\), where first term is value in seconds \({ }^{2} /\) pound, second converts to kilograms, and third is scale factor. Octal value is 2476 , corresponding to about \(0.90706 \mathrm{E}-5\) seconds \({ }^{2} /\) pound.
KMJ ( \(\mathrm{KMJ}_{\mathrm{O}}, \mathrm{KMJ}_{1}, \mathrm{KMJ}_{2}\) ) : Single precision value of the one-jet acceleration about roll, pitch, and yaw axes respectively, scale factor \(\mathrm{B}-13\), units of revolutions/ (deci-second centi-second), so that multiplication of a time in centi-seconds by KMJ yields a rotation rate in revolutions/deci-second. The quantities are computed in "S4O.14", with pitch and yaw values the same.

KTLXdI: See Digital Autopilot TVC Routines.
LEMMASS: Single precision value of LM mass loaded by R2 of N47, and used in "MASSPROP" if bit 13 of DAPDATRI \(=0\) to compute LMattached mass properties constants. If bit \(1_{4}\) of DAPDATRI \(=1\), is used in "FIXCW" to compute MASS (if DAPDATRI set to indicate that LM not attached, cell contents ignored). Scale factor Bl6, units kilograms, but value should not exceed \(2^{15}\) (or be equal to it) kilograms because of left shift in "MASSPROP": this is about 72000 pounds. For valid MASS computation, sum of CSMMASS and LEMMASS must be less than \(2^{16}\) kilograms.

MASS: Single precision value of vehicle mass, program notation "WEIGHT/G", scale factor Bl6, units kilograms, loaded in "FIXCW" as the sum of CSMMASS and (if specified by DAPDATRI) LEMMASS. Note that the value in this cell is not updated by RO3 ("DONOUN46") unless digit \#l of DAPDATRI is \(1,2,5\), or 6 . Cell is used as if it were double precision in "S40.1", "S40.1B", and "S40.13", and used as proper single precision quantity in "P3'F". If used as "double precision" quantity, least significant half is \(\mathrm{AK}_{\mathrm{O}}\).

MRKRTMP: See Burn Control.
NVWORDI: See Burn Control.
OPTIND: See Optics Computations.
PACTOFF: See Digital Autopilot TVC Routines.
PMANNDX: Single precision cell, scale factor Bl4, loaded in "STICKCHK" with bits \(2-1\) of \(T S\) (set before entering routine). These bits correspond to the "pitch" input, with \(\mathrm{OO}_{2}\) meaning no maneuver, \(\mathrm{Ol}_{2}\) meaning a positive maneuver, \(\mathrm{IO}_{2}\) meaning a negative maneuver, and \(\mathrm{ll}_{2}\) treated the same as \(\mathrm{OO}_{2}\) except for rate-command use of the RHC (see "T5PHASE2"). TS is set to the "true" values of the input information (which for the controllers have an inversion from the binary values, so that a binary 0 channel input represents a logical 1).

RACFAIL: Single precision cell, scale factor Bl4, set in "S4l.2" based on Quad failure information in DAPDATR2. It is set to 0 if Quads A and C are both indicated as functioning; it is set to +1 if Quad A is indicated as having failed; and it is set to -l if Quad A is indicated as functioning and Quad C as not functioning. See information below.
RATEINDX: Single precision cell, scale factor Bl4, set in "S4l.2" to bits \(2-1\) of DAPDATRI (shifted left one place for convenience in indexing double precision constants). Value is 0 for a specified maneuver rate of \(0.05^{\circ} /\) second; value is 2 for a specified maneuver rate of \(0.2^{\circ} /\) second; value is 4 for a specified maneuver rate of \(0.5^{\circ} /\) second ; and value is 6 for a specified maneuver rate of \(2.0^{\circ} /\) second.

RBDFAIL: Single precision cell, scale factor B14, set in "S41.2" based on Quad failure information in DAPDATR2. It is set to 0 if Quads B and D are both indicated as functioning; it is set to +1 if Quad B is indicated as having failed; and it is set to -l if Quad B is indicated as functioning and Quad D as not functioning. See information below.

RCSFLAGS: Single precision flag word used for control of various RCS DAP functions. The individual bits have the following meanings:

\section*{Bit}

1

\section*{Meaning}

Set in "NEWANGL" on initial pass (also in R67) if RATEINDX = 6 (meaning large-rate R60 maneuver), and used in "T5PHASE2" to control setting of ATTKALMN (to -l if bit is 1 , and otherwise to 0 ) correspondingly. It avoids having attitude maneuver routine change ATTKALMN if RCS DAP filter is being started up. Reset e.g. in "STOPRATE".
Bit set in RCS DAP if rate filter must be initialized before computations are performed. It is set if e.g. bit 15 of channel 31 is 1 (no G\&N control), or if bit 6 of IMODES33 = 1, indicating IMU data not usable; it is reset e.g. in "REDAP".
Bit set 1 in "T5PHASE2" for a change in RHC inputs, to signify that roll damping must be completed before attitude"hold"resumed, and reset zero in "J23" if no roll firing required by phase-plane.
Bit set 1 in "T5PHASE2" for a change in RHC inputs, to signify that pitch damping must be completed before attitude"hold"resumed, and reset zero in "J23" if no pitch firing required by phase-plane.
11 Bit set 1 in "T5PHASE2" for a change in RHC inputs, to signify that yaw damping must be completed before attitude"hold"resumed, and reset zero in "J23" if no yaw firing required by phase-plane.
Bits set 0 in "T5PHASE2" and then set, for a change in RHC inputs, to the changed bits for roll(if any), to force a firing in "J23" (if not otherwise required by phase-plane) for that cycle, provided EDOT for that axis not too close to 0 . Bit 1 if input \(l \rightarrow 0\) or \(0 \rightarrow 1\). Bits set 0 in "T5PHASE2" and then set, for a change in RHC inputs, to the changed bits for yaw (if any): see bits 10-9.
Bits set 0 in "T5PHASE2" and then set, for a change in RHC inputs, to the changed bits for pitch (if any): see bits 10-9.
Bit used in "KMATRIX" to cause "NEEDLER" to be performed on one pass (if presently O) and a new AK value to be loaded on the next pass (a pass takes place once every 0.1 second).

Bit set to 1 to cause "NEEDLER" routine to perform the initialization functions for the FDAI display (reset error counter to 0 etc.). Reset by "NEEDLEIl".
Bit set to 1 in "NEEDLEII" to signify that first pass of initialization function has been completed (causes, with bit \(3=0\), "NEEDIFR2" to be entered at the next transfer to "NEEDLER"). Reset by "NEEDLER2".
Bit set 0 at end of "T6SETUP" and in "ZEROJET" to indicate to "T6START" that the next TIME6 interrupt that is valid should cause RWORDI, PWORDI, and YWORD1 to be loaded. The "T6START" routine then resets the bit to 1.

REPFRAC: See Digital Autopilot TVC Routines.
RMANNDX: Single precision cell, scale factor B14, loaded in "STICKCHK" with bits 6-5 of TS (set before entering routine), shifted right 4 places. These bits correspond to the "roll" input (see PMANNDX).

T5LOC: Address controlling where computations begin when program interrupt \#2 (controlled by TTME5) is received. It is set to "T5IDLOC" to cause these program interrupts to be ignored: this setting is done as part of a "fresh start" and also in "STABLISH" if bits \(14-13\) of DAPDATRI are \(\mathrm{OO}_{2}\). If a restart is encountered, the loading of T5LOC is controlled by bits 15-14 of FLAGWRD6, and T5LOC is set to "T5IDLOC", "REDORCS", "REDOTVC", and "REDOSAT" for bits \(15-14=00_{2}, \mathrm{Ol}_{2}, 10_{2}\), and \(\mathrm{ll}_{2}\) respectively.

For the Saturn DAP, T5LOC = "SATSTICK" as set by "REDOSAT" and "SATSTICK". "REDOSAT" is entered due to T5LOC setting to that address for a restart or by "SATSTKON" (entered from "STABLISH"). TTME5 setting is such as to cause "SATSTICK" to be entered every 0.1 second.

For the RCS DAP, startup is accomplished (from "STABLISH" or from "ENGINOFF", "V97E", or "V97T") by entering "RCSDAPON", which sets TIME5 to cause transfer to "RCSATT" (T5IOC setting) in 0.6 seconds. The delay if from "AUTO37" is 3.1 seconds. Two interrupts 20 ms apart cause entrance to "RCSATT", with subsequent branching controlled by T5PHASE (see Digital Autopilot RCS Routines). After the second "RCSATT" entrance, if filter not being initialized T5LOC is set to "JETSLECT" with another 20 ms delay; that routine in turn resets T5LOC to "RCSATT" with a 60 ms delay (for the 100 ms RCS DAP cycle rate).

For the TVC DAP, T5LOC is set to "T5IDLOC" in "IGNITION" shortly after engine-on, to disable RCS DAP entrances. About 0.4 seconds later, T5LOC is set to "TVCDAPON" (with delay of about 10 ms ). "TVCDAPON" sets T5LOC to "TVCINIT1" (delay about 10 ms ) which in turn, after entering "TVCINIT4", sets T5LOC to "DAPINIT" with delay from T5TVCDT ( 20 ms for LM-off). "DAPINIT" in turn sets T5LOC to "PITCHDAP" with delay of one complete TVC DAP cycle ( 40 ms for LM-off), causing entrance to "PITCHDAP" for LM-off about 0.48 seconds after engine-on. "PITCHDAP" sets T5LOC to "YAWDAP", which resets it to "PITCHDAP", each with delay from T5TVCDT, i.e. loop cycle rate of 40 ms for LM-off. The TVC DAP also uses waitlist task means to perform "TVCEXEC" every 0.5 second (starting .51 seconds after "TVCINIT4"), which in turn calls the roll DAP task, "ROLLDAP", 0.03 seconds after being entered. If a restart, "REDOTVC" sets T5LOC to "ENABL2", which in turn sets to "CMDSOUT", which in turn sets to either "TVCINIT1" or "DAPINIT" depending on timing of restart.

For the entry DAP, "CM/DAPON" sets T5LOC to "T5IDLOC", and the waitlist task "READGYMB", after entering "BODYRATE", sets it to "ATTRATES" (with 0.01 second delay). After executing the computations, T5LOC again set to "T5IDLOC" (at end of "CM/FDAIR"). The entry DAP cycle rate is defined by the O.l-second waitlist calls of "READGYMB".

T6LOC: Address controlling where computations begin when program interrupt \#l (controlled by TIME6) is received. The interrupt is not generated unless TIME6 is counting down; contrary to TIME5, the countdown of TIME6 must be enabled by a channel bit (bit 15 of channel 13). It is set to "T5IDLOC" in "CM/DAPON" (since the Entry DAP does not make use of program interrupt \#l).

In the RCS DAP, T6LOC is set to "T6START" in "ZEROJET" (which is also entered if no DAP or if Saturn DAP specified, to zero output channels). During normal RCS DAP operation, TIME6 is set to 14 ms in "JETSLECT", so that jets scheduled to be fired from about 86 ms to 100 ms will all be fired for the full 100 ms . Otherwise, TIME6 is set in "T6START" to the appropriate delay.

In the TVC DAP, T6LOC is used for timing of the roll RCS jets, and is set to "NOROLLI" in "JETROLL".

THETADX: See Digital Autopilot RCS Routines.
TIME5: Computer hardware clock register (cell \(0030_{8}\) ), incremented by 1 each 10 ms under hardware control. Its overflow (reaching a value of \(214=16384\) ) causes program interrupt \(\# 2\) ("T5RUPT"), which is coded to start performing the computations whose starting address is in T5LOC. Setting TINE5 "to cause program interrupt \#2 in 20 ms ", for example, is accomplished by setting TIME \(5=37776_{8}\).
TINE6: Computer hardware clock register (cell 00318), decremented by 1 each 0.625 ms (i.e. at a 1600 pps rate) under hardware control if bit 15 of channel \(13=1\). Because of decrement rate, can be considered to contain time-interval information with scale factor BlO in units of centi-seconds. Its reduction to zero causes program interrupt \#l, which is coded to start performing the computations whose starting address is in T6LOC (via "T6RUPT").
TUSED: See Digital Autopilot Entry Routines.
TVCPHASE: See Digital Autopilot TVC Routines.
TVCPITCH: Single precision value of computer special erasable memory counter cell 0054 when used to provide pitch steering commands for the SPS engine gimbal (if bit 8 of channel 12 is 1). Pulses are provided from the cell to change the value of the associated error counter at a 3200 pps rate, until the cell contents reduced to zero, provided bit 11 of channel 14 is set. The computer's image of what is in the error counter is in PCMD (see Digital Autopilot TVC Routines), i.e. the "integral" of TVCPITCH output since error counter reset, by zeroing of bit 2 of channel 12, e.g. in "S40.6". One pulse gives 85.41 arc seconds of output, thus leading to the expression of scaling information as "B14 in units of CDU actuator output pulses" or BO in units of ASCREV (actuator revolutions, namely \(2^{14}\) pulses or about 1.07975111 revolution). There are about 42.14963 pulses per degree. The same cell is used for CDUSCMD (see Optics Computations), and hence optics use must be disabled when the cell is used for TVC purposes.

TVCYAW: Single precision value of computer special erasable memory counter cell 0053 , when used to provide yaw steering commands for the SPS engine gimbal (if bit 8 of channel 12 is 1). Pulses are provided from the cell to change the value of the associated error counter at a 3200 pps rate, until the cell contents reduced to zero, provided bit 12 of channel 14 is set. The computer's image of what is in the error counter is in YCMD (see Digital Autopilot IVC Routines). Scaling same as IVCPITCH, and the same cell is also used for CDUTCMD (see Optics Computations).

VARK: See Digital Autopilot TVC Routines.
VARSTO: Single precision quantity computed in "MASSPROP" for use in "FIXCW" (cell not time-shared in TVC DAP), scale factor B2O, units kilogram-meters \({ }^{2}\), giving the value of IXX at "breakpoint" (when DELCMWT \(=0\) ).

VARSTI: Single precision quantity computed in "MASSPROP", scale factor B2O, used as the value of IAVG at "breakpoint", units kilogrammeters \({ }^{2}\).

VARST2: Single precision quantity computed in "MASSPROP", scale factor B2, units seconds \({ }^{2}\), used as the "breakpoint" value of IAVGdTLX.

VARST3: Single precision quantity computed in "MASSPROP", scale factor \(\mathrm{B}-12\), units seconds \({ }^{2} /\) kilogram, giving the slope of IAVGdTLX with CSMMASS for values above "breakpoint" (DELCMWT greater than 0).

VARST4: Single precision quantity computed in "MASSPROP", scale factor B6, units kilogram-meters \({ }^{2}\) per kilogram, giving the slope of IAVG with CSMMASS for values above "breakpoint" (DELCMWT greater than 0).

VARST5: Single precision quantity computed in "MASSPROP", scale factor B6, units kilogram-meters \({ }^{2}\) per kilogram, giving the slope of IXX with CSMMASS (both above and below "breakpoint"). Octal value is same for LM-off and LM-on (regardless of LFMMASS), including APS only.
VARST6: Single precision quantity computed in "MASSPROP", scale factor B6, units kilogram-meters \({ }^{2}\) per kilogram, giving the slope of IAVG with CSMMASS for values not above "breakpoint" (DELCMWT not greater than 0).
VARST'7: Single precision quantity computed in "MASSPROP", scale factor B-12, units seconds \({ }^{2}\) kilogram, giving the slope of IAVGdTLX with CSMMASS for values not above "breakpoint" (DELCMWT not greater than 0).

VARST8: Single precision quantity computed in "MASSPROP", scale factor B2O, units kilogram-meters \({ }^{2}\), meaningful only for LM-on, and used to increment VARSTI if descent stage off: it is added to VARSTI, but is computed for IM-on from two constants both of which are negative, hence a reduction in VARSTl results from the addition.

VARST9: Single precision quantity computed in "MASSPROP", scale factor B2, units seconds \({ }^{2}\), meaningful only for LM-on, and used to increment VARST2 if descent stage off.

XTRANS: Single precision cell, scale factor B14, set 0 if bits 10 and 7 of DAPDATRI are the same value (allows four-jet X-translation); set to +1 if bit 7 is 1 (allows use only of quad \(B / D\) for X-translation) ; and set to -l if bit 10 is 1 (allows use only of quad A/C for X-translation). Setting performed in "S4l.2". See information below.

YACTOFF: See Digital Autopilot TVC Routines.
YMANNDX: Single precision cell, scale factor B14, loaded in "STICKCHK" with bits 4-3 of TS (set before entering routine), shifted right 2 places. These bits correspond to the "yaw" input (see PMANNDX).

Summary of DAP Performance for RCS Failures

The only knowledge that the computer program has of RCS failures is by means of the information in DAPDATR2: there is no attempt made to deduce failures from observed spacecraft responses. The Entry DAP has no input provided to specify failed CM RCS jets, and the TVC roll DAP alternately uses (for rolls in a given direction) the \(A / C\) and B/D Quads, without regard to the RCS jet status information provided in DAPDATR2. Consequently, it is only the RCS DAP which makes use of jet status information furnished in DAPDATR2.

Routine "S4l.2" serves as the interface between the information in DAPDATR2 and the RCS DAP jet selection logic (which is normally entered every 0.1 seconds while the RCS DAP is capable of providing output commands, and which starts at "JETSLECT"). Certain features of "S4l.2" simplify the subsequent coding, but also have an influence upon the performance of the program that is not necessarily evidenced in the displays provided to the crew. These features include:
a) If Quad A is reported failed, the program assumes (without checking and with no special indication to the crew) that Quad C is functional.
b) If Quad B is reported failed, the program assumes (without checking and with no special indication to the crew) that Quad D is functional.
c) If neither Quad \(A / C\) or Quad \(B / D\) is specified for \(X\)-translation, the program assumes that both are to be used.
d) If only Quad A/C is specified for X-translation, no attempt is made to use Quad B/D for this purpose (even if Quad A or Quad C has a reported failure). Similarly for roll Quad selection. e) If only Quad B/D is specified for X-translation, no attempt is made to use Quad A/C for this purpose (even if Quad B or Quad D has a reported failure). Similarly for roll Quad selection.

In addition to the features of "S4I.2" that affect program performance, the jet selection logic itself has certain characteristics which strongly influence program performance in the presence of reported RCS failures. These include the following:
l) If only Quad \(A / C\) is specified for X-translation, and Quad A or Quad C has a reported failure, no X-translation is performed except that which may incidentally arise from the single-jet firings to perform pitch control (or yaw control in the event that Quad B or Quad D also has a reported failure).
2) Similar to \#l, except with Quad B/D instead of Quad A/C. 3) If both Quad \(A / C\) and Quad B/D are specified for \(X\)-translation, proper translation from the unfailed Quad (plus that which may incidentally arise from single-jet firings) will be performed. The routine used to estimate burn time ("S40.13"), however, will perform its computations based on four-jet ullage. If Quads \(A / C\) and \(B / D\) both have reported failures, the situation of \#l applies.
4) If Quad A/C is specified for roll, and Quad A or Quad C has a reported failure, then no Y-translation is performed except that which may incidentally arise from the single-jet firings to perform roll control, "in which case the astronaut should switch to B/D roll."
5) If Quad B/D is specified for roll, and Quad B or Quad D has a reported failure, then no Z-translation is performed except that which may incidentally arise from the single-jet firings to perform roll control, "in which case the astronaut should switch to A/C roll."
6) If Quad A/C is specified for roll, and Quad B or Quad D has a reported failure, then single-jet Z-translation will be performed for that portion of the O.l-second DAP cycle not required for roll attitude control (even though a roll torque is produced).
7) If Quad B/D is specified for roll, and Quad A or Quad C has a reported failure, then single-jet Y-translation will be performed for that portion of the O.l-second DAP cycle not required for roll attitude control (even though a roll torque is produced).
8) If Quad A/C is specified for roll, and Quad B or Quad D has a reported failure, then the jet used in \#6 will also be fired during the portion of the O.l-second DAP cycle that is used for roll attitude control if and only if the roll torque on the vehicle is not reduced to 0 during this interval. It would be fired if no Quad A/C failures were reported (since two-jet torque is used) and no Y-translation is simultaneously specified; other cases can best be analyzed by review of the jet table information itself (see Digital Autopilot RCS Routines).
9) If Quad B/D is specified for roll, and Quad A or Quad C has a reported failure, then the jet used in \#7 will also be fired during the portion of the O.l-second DAP cycle that is used for roll attitude control if and only if the roll torque on the vehicle is not reduced to 0 during this interval. It would be fired if no Quad B/D failures were reported and no Z-translation is simultaneously specified; see jet table information for other conditions.
10) As suggested by \#1 - \#3 above, the philosophy of \#6 - \#9 above for Y-translation and Z-translation is not employed for X-translation.

        Return

\section*{Quantities in Computations}

See also list of major variables and list of routines

ACORBD: See Digital Autopilot Interface Routines.
ADB: See Digital Autopilot Interface Routines.
ADBVEL: Single precision value of (ADB \(+\mathrm{K}_{\text {afrg }}\) ) sgn EDOT used in "JLOOP", scale factor \(B-1\), units revolutions.

ADOT \(\left(\mathrm{ADOT}_{0}, \mathrm{ADOT}_{1}, \mathrm{ADOT}_{2}\right)\) : Filtered value of roll, pitch, and yaw body-angle rates (about "control axes"), scale factor B-3, units revolutions/deci-second (one deci-second is 0.1 seconds, the iteration rate of RCS DAP). Alternatively, could be considered scaled BO in "units" of \(450^{\circ} /\) second. Cells are OMEGAB in TVC DAP.

AERR: Single precision value of ERROR about appropriate axis used in "JLOOP", scale factor B-1, units revolutions.

AERRVEL: Single precision value of AERR sgn EDOT used in "JLOOP", scale factor \(B-1\), units revolutions.
\(A K\left(A K K_{0}, A K_{1}, A K_{2}\right):\) See Digital Autopilot Interface Routines.
AMGBl, AMGB4, AMGB5, AMGB7, AMGB8: Single precision matrix elements which are used by RCS DAP to transform information from gimbal to control axes, scale factor BO, computed once per second by "AMBGUPDT". The matrix from gimbal to control axes may be written as:
\[
\left[\begin{array}{ccc}
1 & \text { AMGBl } & 0 \\
0 & \text { AMGB4 } & \text { AMGB5 } \\
0 & \text { AMGB } 7 & \text { AMGB8 }
\end{array}\right]
\]

In order to "account for the roll displacements of the reaction jets with respect to navigation base coordinates", the outer gimbal angle ( \(C D U_{X}\) ) used to compute the matrix elements is decremented by \(K_{q u a d a n}\), thus giving the "control axes" result.

ANGREF: Value of reference angle (THETAD or CPHIX) used in "KMATRIX" to compute display information of total attitude error (if required), scale factor \(B-1\), units revolutions.

ATTKALMN: Single precision quantity, scale factor Bl4, used to select appropriate gains in "RCSATT". To initialize the filter, cell is set to 11 (decremented to 10 before used) in "REDAP", and decremented in "T5PHASE2" (with subsequent performance of further computations, including jet firings, bypassed until ATTKALMN \(=0\) ). A value of 0
is the normal steady-state filter gain value; a setting of -1 is used for high-rate (RATEINDX = 6) automatic maneuvers (set in "T5PHASE2" if bit 15 of RCSFLAGS \(=1\) ) or RHC-commanded maneuvers at high rate; a setting of -2 is used (set in "JETSLECT") if translation hand controller inputs with LM-off are provided; and a setting of -3 is used for translation inputs with LM-on. The reset to 0 is accomplished (from negative values) in "T5PHASE2" if bit 15 of RCSFLAGS \(=0\).

ATTSEC: Single precision quantity, scale factor B14, initialized to 0 in "REDAP" and used in "KMATRIX" to cause "AMBGUPDT" to be established once a second (every tenth entrance to "KMATRIX").

BIAS ( BIAS \(_{0}\), BIAS \(_{1}\), BIAS \(_{2}\) ): Set of single precision angles, scale factor B-1, units revolutions, "added to the attitude errors to provide additional lead and prevent overshoot when starting an automatic maneuver." They are added to ERROR (used as the attitude error in "JLOOP") if HOLDFLAG negative, and the values are computed in "LOCSKIRT" and "MANUSTOP" (where set 0). Magnitude corresponds to the value of ( \(1 / 0.6\) ) times maneuver rate (see Kiasc in Attitude Maneuvers), and otherwise is 0.
BLASTO, BLASTl, BLAST2: Set of 3 quantities handled double precision, used for RCS jet burn time control. Before "T6SETUP" is entered, BLASTO is associated with roll, BLASTl with pitch, and BLAST2 with yaw. The most significant halves of each word have required firing time for RWORDI, PWORDI, and YWORDI respectively, scale factor BlO, units centi-seconds. The least significant halves contain an index which identifies the axis in the most significant half (set at start of "T6SETUP" to 0, 4, and 11 respectively for convenience in the coding). Cells subsequently arranged in order of increasing time durations, then replaced with time intervals. In "T6START", most significant half set +0 if associated time in TIME6, and -1 (B14, i.e. \(-1 / 16\) B10) after the expiration of that interval.

C31FLWRD: Single precision flagword used for backup of bits \(15-13\) of channel 31 (by bits 15-13, i.e. digit "A") and bits 5-4 of channel 33 (by bits \(5-4\), i.e. digit "D"). It can be loaded by NOl means (address 0374 ). For digit A, a value of 0 (or 4) means should use bits \(15-13\) of channel 31; values of l-3 mean G\&N Control (Free, Attitude Hold, and Auto respectively); values of \(5-7\) mean SCS Control. For digit D, a value of 0 means use bits 5-4 of channel 33; of l-3 mean optics CMC, Zero, and Manual respectively (values of \(4-7\) mean the same as \(0-3\) respectively). Should be pad-loaded to zero; digits B, C, and E ("ABCDE") are ignored.

CDUXD: See Attitude Maneuvers (used in "KMATRIX" to update THETADX if HOLDFLAG is negative).

CH31TEMP: Single precision cell used in "T5PHASE2" to contain the previous value of channel 31 inputs (bits 6-1 are rotational hand controller inputs) if bits 6-1 change, in order to detect binary \(1 \rightarrow 0\) transitions (logic 0 to 1 ) for RHC control purposes: binary \(0 \rightarrow 1\) are also detected, of course. It is initialized to 77777 g by "REDAP".

CHANTEMP: Single precision cell used in Free Mode (at the start of "AHFNOROT") to retain previous input of channel 32 ( cf. CH31TEMP), for use in providing "minimum impulse" control. Initialized to 777778 in "REDAP".

CPHIX: Set of reference angles for attitude error (AK) display, scale factor B-1, units revolutions. They can be loaded by N17, or set to present CDU values by verb 60 (and displayed on FDAI by verb 63).

DELCDU: See Attitude Maneuvers (used in "KMATRIX" to increment CDUXD values if HOLDFLAG negative).

DELTEMP: Value of CDU angle change, converted to body rates, computed in "RCSATT", scale factor B-1, units revolutions/deci-second. It is computed double precision.
DFT ( \(\mathrm{DFT}_{0}, \mathrm{DFT}_{1}, \mathrm{DFT}_{2}\) ): Single precision equivalent times, scale factor Blo, units centi-seconds, giving the equivalent single-jet burning time computed for roll, pitch, and yaw axes respectively, for use in the rate filter (in "RCSATT") to update body-angle rates.
\(\mathrm{DRHO}\left(\mathrm{DRHO}_{0}, \mathrm{DRHO}_{1}, \mathrm{DRHO}_{2}\right)\) : Value of body rate used as input to ADOT filter, scale factor B-l, units revolutions/deci-second, computed in "RCSATT" as the difference between measured (from CDU data) and ADOT body rates, plus a weighted estimate of previous DRHO.

EDOT: Value of attitude rate error used in "JLOOP", scale factor B-3, units revolutions/deci-second (set to \(\mathrm{ADOT}_{i}\), decremented by WBODY \(_{i}\) if HOLDFLAG \(\neq 0\) ). Absolute value stored in EDOTVEL.

ERROR (ERROR \({ }_{O},{E R R O R_{1}}_{1}, E R R O R_{2}\) ): Single precision value of attitude error for automatic maneuvers or attitude hold (computed in "AHFNOROT"), or RHC maneuvers (loaded with MERROR in "T5PHASE2"), used to load AERR at the start of "JIOOP". Scale factor is B-1, units revolutions. Set 0 if free mode inputs are made, and can be displayed on attitude error needles ( \(\mathrm{AK}=-\mathrm{ERROR}\) ) if bit 9 (NEEDLFIG) of FLAGWRDO \(=0\) (by e.g. V6I means).

HOLDFLAG: See Digital Autopilot Interface Routines.
IMODES33: See IMU Computations.
JdM \(\left(J d M_{O}, J d M_{1}, J d M_{2}\right)\) : See Digital Autopilot Interface Routines.
\(K_{1_{4} m s}:\) Single precision constant, program notation \("=1_{4} M S\) ", scale factor B10, units centi-seconds. Value is \(23 \times 2^{-14}\), corresponding to about 14.4 milliseconds.
\(K_{\text {afrg }}\) : Single precision constant, program notation "FOUR", scale factor B-1, units revolutions, giving the "flat region" for "JLOOP" (the offset of the dead-zone line when the rate error changes polarity). Value is \(4 \times 2^{-14}\), corresponding to about \(0.044^{\circ}\) ("encourage limit cycle").
\(K_{\text {dftm }_{i}}\) : Set of single precision constants, program notation "DFTMAX", scale factor BlO, units centi-seconds. Values are:
\begin{tabular}{rlll} 
i & \multicolumn{5}{l}{} & Value & True Value \\
-3 & \(-480 \times 2^{-14}\) & -0.3 seconds \\
-2 & \(-320 \times 2^{-14}\) & -0.2 seconds \\
-1 & \(-160 \times 2^{-14}\) & -0.1 seconds \\
0 & 0 & 0.0 seconds \\
1 & \(160 \times 2^{-11_{4}}\) & 0.1 seconds \\
2 & \(320 \times 2^{-11_{4}}\) & 0.2 seconds \\
3 & \(480 \times 2^{-14}\) & 0.3 seconds
\end{tabular}
\(\mathrm{K}_{\mathrm{gn}}^{\mathrm{i}} \mathrm{:}\) : Set of single precision constants, program notation "GAIN1", scale factor BO, used in "RCSATT" to obtain a new value of DRHO (from samples taken 10 times/second). Value of index given by contents of ATTKALMN.
\begin{tabular}{rlll} 
i & Value & True Value & \\
10 & 0.9342 & 0.93420 & \\
9 & 0.8151 & 0.81512 & \\
8 & 0.6933 & 0.69330 & True Value obtained by \\
7 & 0.5970 & 0.59698 & converting octal memory \\
6 & 0.5223 & 0.52228 & \\
5 & 0.4634 & 0.46338 & \\
4 & 0.4161 & 0.41608 & \\
3 & 0.3774 & 0.37738 & \\
2 & 0.3452 & 0.34521 & \\
1 & 0.3180 & 0.31799 & \\
0 & 0.0640 & 0.06403 & (steady-state gain) \\
-1 & 0.2112 & 0.21118 & (high-rate automatic/RHC maneuvers) \\
-2 & 0.8400 & 0.84003 & IM-off translation) \\
-3 & 0.2112 & 0.21118 & IMM-on translation)
\end{tabular}
\(K_{\text {gn2 }}\) : Set of single precision constants, program notation "GAIN2", scale factor BO, used in "RCSATT" to obtain a new value of ADOT (from DRHO information acquired 10 times/second). Value of index given by contents of ATTKALMN.
\begin{tabular}{rlll} 
i & \(\underline{\text { Value }}\) & True Value & \\
10 & 0.8683 & & \\
9 & 0.4817 & 0.86829 & \\
8 & 0.2955 & 0.48169 & See above note for \\
7 & 0.1985 & 0.29547 & \(\mathrm{~K}_{\text {gnl }}\) i \\
6 & 0.1422 & 0.19849 & \\
5 & 0.1069 & 0.14221 & \\
4 & 0.0832 & 0.10687 & \\
3 & 0.0666 & 0.08319 & \\
2 & 0.0545 & 0.06659 & \\
1 & 0.0454 & 0.05450 & \\
0 & 0.0016 & 0.04541 & \\
-1 & 0.0174 & 0.00159 & \\
-2 & 0.3600 & 0.01740 & \\
-3 & 0.0174 & 0.35999 &
\end{tabular}
\(K_{\text {m75degs }}:\) Single precision constant, program notation "-75DEGS", scale corresponding to approximately \(-75^{\circ}\). Octal value is 62524 , which corresponds (after a one-bit correction reflecting formation of the absolute value) to \(-15254_{\text {g }}\), or about \(-75.015^{\circ}\) (ignoring 2 's complement).
\(K_{\text {mantab }} \quad\left(\begin{array}{l}i=0-7): ~ S e t ~ o f ~ s i n g l e ~ p r e c i s i o n ~ c o n s t a n t s, ~ p r o g r a m ~ n o t a t i o n ~\end{array}\right.\) The single precision constants are shifted right (double precision) by 6 places for loading into WBODY and by 8 places for decrementing MERROR in "T5PHASE2". Nominal values are:
\(i\) Value Corresponds to
\(0 \quad 0.0071111 \quad 0.05\) degree \(/ \mathrm{sec}\)

Nominal value times \(-0.0071111 \quad-0.05\) degree \(/ \mathrm{sec} \quad 3600 / 512\) gives value
\(0.028444 \quad 0.20\) degree \(/ \mathrm{sec}\)
-0.028444 -0.20 degree/sec
\(4 \quad 0.071111 \quad 0.50\) degree/sec
\(5-0.071111 \quad-0.50\) degree \(/ \mathrm{sec}\)
\(6 \quad 0.284444 \quad 2.00\) degree \(/ \mathrm{sec}\)
\(7 \quad-0.284444 \quad-2.00\) degree/sec in degrees/sec.
\(K_{\text {mintu }}\) : Set of single precision constants, program notation "MINTAU", scale factor B10, units centi-seconds. Values for \(i=0\) and \(i=3\) are zero; for \(i=1\), value is \(23 \times 2^{-14}\) (about 14.4 ms ); and for \(i=2\), value is \(-23 \times 2^{-14}\) (about -14.4 ms ).
\(K_{\text {mptlsc }}\) : Single precision constant, program notation "=-. ISEC", scale factor B10, units centi-seconds. Value is \(-160 \times 2^{-14}\), corresponding to -0.1 second.
\(K_{n j t_{i}}\) : Set of single precision constants, program notation "NJET", scale factor BO, used to correct jet burn times (which are derived based on one-jet operation) for the number of jets actually to be used, and also to compensate for polarity of TAU (negative for negative jets). Values are:
i Value
-3 -0.333333
-2 -0.5
-1 -0.999999
00.0
10.999999
20.5
30.333333
\(K_{\text {p24 }}\) : Single precision constant, program notation \(\|=.24\) ", scale factor B-2, value 0.24 . Used in "REDAP" as an initial condition setting for SLOPE. Value corresponds to ( -1 ) \(\times-0.6 \times 0.1 \times 2^{2}\), where first term is an equation factor, second is slope of attitude rate error limit line vs attitude error (in units of (revolutions/ second)/revolution), third converts to units of deci-seconds, and fourth is scale factor.
\(K_{p t l s c}:\) Single precision constant, program notation " \(=+\). ISEC", scale factor Bl0, units centi-seconds. Value is \(160 \times 2^{-14}\), corresponding to 0.1 second.
\(K_{\text {pytab }_{i}}\) : Single precision set of constants, program notation "PYTABLE", \({ }^{1}\) giving information on pitch and yaw jets selected, together with the number of jets used for the function. See information below.
\(K_{\text {quadan }}\) : Single precision constant, program notation "QUADANGL", scale factor B-l, units revolutions, "used to account for the roll displacements of the reaction jets with respect to navigation base coordinates." Value is \(660 \times 2^{-14}\), corresponding to about \(7.251^{\circ}\).
\(K_{\text {rtab }}\) : Single precision set of constants, program notation "RTABLE", igiving information on roll jets selected (for AC or BD quads), together with number of roll jets (with polarity). See information below.
\(K_{\text {sope2 }}\) : Single precision constant, program notation "SLOPE2", scale factor B-2, units (revolutions/deci-second)/revolution. Value is 0.32 , corresponding to \((-1) \times-0.8 \times 0.1 \times 2^{2}\), where the first term is an equation factor, second is "hysteresis slope" of attitude rate error vs attitude error (in units of (revolutions/second)/revolution), third converts to units of deci-seconds, and fourth is scale factor(helps disturbances).
\(K_{\text {whdsop: }}\) Single precision constant, program notation "WLH/SLOP", scale factor B-l, units revolutions. Octal value is 001148 , corresponding to about \(0.835^{\circ}\). Nominal value is \((0.4+0.1) / 0.6=0.833^{\circ}\) : first numerator term is nominal "rate limit" of \(0.4^{\circ} /\) second, second is nominal half-width of \(0.10 /\) second, and denominator is SLOPE.
\(K_{\text {wim }}\) : Constant, program notation "WL", scale factor B-3, units revolutions/deci-second. Value is 0.0008888888 , corresponding to about \(0.4^{\circ} /\) second (nominal "rate limit").
\(K_{\text {wimh }}\) : Constant, program notation "WLH", scale factor B-3, units revolutions/deci-second. Value is 0.0011111111 , corresponding to about \(0.5 \%\) second ("rate limit" plus half-width of \(0.1 \% / \mathrm{sec}\) ).
\(K_{\text {wimmh }}\) : Constant, program notation "WLMH", scale factor B-3, units revolutions/deci-second. Value is 0.000666666 , corresponding to about \(0.3^{\circ} /\) second ("rate limit" minus half-width of \(0.1 \% / \mathrm{sec}\) ).
\(K_{\text {wmhd sop: }}\) Single precision constant, program notation "WL-H/SLP", scale factor B-l, units revolutions. Octal value is 00055 , corresponding to about \(0.494^{\circ}\). Nominal value is \((0.4-0.1) / 0.6=0.500^{\circ}\) : cf. \(\mathrm{K}_{\text {whdsop }}\) for meaning of terms.
\(K_{\mathrm{xn} \text { Indx }}\) : Set of single precision constants, program notation "XLNINDX", \(i_{\text {scale }}\) factor B14, used to provide index information from input data on control configuration. Value is equal to i for \(i=0,1\), and 2, and is equal to zero for \(i=3\).
\(K_{\mathrm{X}_{\mathrm{xtndx}}^{i}}\) : Set of single precision constants, program notation "XLNNDX", \({ }_{i}\) scale factor B14, used to provide index information for combining translation and rotation commands. Value is equal to (3 i) for \(i=0, l\), and 2 , and is equal to zero for \(i=3\).
\(K_{y z t a b_{i}}\) : Set of single precision constants, program notation "YZTABLE", giving information permitting the combination of \(Y\) or \(Z\) translations with roll, as well as number of jets giving a "net roll torque". See information below.

KMJ ( \(\mathrm{KMJ}_{\mathrm{O}}, \mathrm{KMJ}_{1}, \mathrm{KMJ}_{2}\) ): See Digital Autopilot Interface Routines.
MERROR: Value of integrated rate error used with RHC ("manual") control, scale factor \(B-1\), units revolutions, computed in double precision (a single precision version is loaded into ERROR in "T5PHASE2" if manual RHC inputs are provided). The cells are initialized to 0 in "REDAP" and are also set 0 in "T5PHASE2" if bits 13-11 of RCSFLAGS are not all 0 (i.e. damping not done); they are updated in "RCSATT" by the measured (from CDU first differences) attitude rate, from which is subtracted desired rate (if damping done) in "T5PHASE2".

NPJETS: Single precision value of number of pitch jets to be fired, scale factor \(\mathrm{Bl}_{4}\). Sign of \(\mathrm{TAU}_{1}\) added in "PITCHTTM".

NRJETS: Single precision value of number of roll jets to be fired (with sign indicating polarity), scale factor Bl4.

NYJETS: Single precision value of number of yaw jets to be fired, scale factor \(\mathrm{Bl}_{4}\). Sign of \(\mathrm{TAU}_{2}\) added in "YAWTIME".

PINDEX: Single precision index parameter, scale factor B14, indicating the polarity of the pitch command desired: 0 if none, 1 if plus pitch, and 2 if minus pitch.

PMANNDX: See Digital Autopilot Interface Routines.
PWORD1, PWORD2: Single precision cells containing in bits 8-1 the pitch-command bits to be loaded in channel 5 when "T6START" is entered and after the pitch time duration has expired, respectively. The pitch time duration originally is in BLASTl+O.

RACFAIL: See Digital Autopilot Interface Routines.
RATEINDX: See Digital Autopilot Interface Routines.
RBDFAIL: See Digital Autopilot Interface Routines.
RCSFLAGS: See Digita \(\perp\) Autopilot Interface Routines.
\(\mathrm{RHO}\left(\mathrm{RHO}_{\mathrm{O}}, \mathrm{RHO}_{1}, \mathrm{RHO}_{2}\right)\) : Value of previous CDU information (initialized in "REDAP") used to compute input to attitude rate filter in "RCSATT", scale factor B-l, units revolutions in twos complement.

RINDEX: Single precision index parameter, scale factor Bl4, indicating the polarity of the roll command desired: 0 if none, 1 if plus roll, and 2 if minus roll.

RMANNDX: See Digital Autopilot Interface Routines.
RWORDl, RWORD2: Single precision cells containing in bits 8-1 the roll-command bits (perhaps combined with \(Y\) and/or \(Z\) axis translation) to be loaded into channel 6 when "T6START" is entered and after the roll time duration has expired, respectively. The roll time duration originally is in BLASTO+O.

SLOPE: Single precision cell, scale factor B-2, units (revolutions/ deci-second)/revolution, set to \(\mathrm{K}_{\mathrm{p} 24}\) in "REDAP" and not subsequently changed. It is a "variable" (i.e. 1 in erasable memory) because the computer hardware divide order is designed to accept operands only from erasable memory.

T5LOC: See Digital Autopilot Interface Routines.
T5PHASE: Single precision cell, scale factor B14, used to control the program branching that takes place when program interrupt \#2 transfers to "RCSATT". A positive non-zero value (of any magnitude) causes the RCS DAP to be initialized; a to value causes "T5PHASE2" to be entered; a negative non-zero value (of any magnitude) causes a DAP "restart" (some of the initialization, i.e. HOLDFLAG, is bypassed), as set in "REDORCS"; and a -0 value causes the computations in "RCSATT" to be continued (to perform the rate filtering functions if appropriate). The continuation of "RCSATT" is also known as "phase l" of the RCS DAP, since the normal sequencing of the RCS DAP is:

T5TINE: Single precision time, scale factor B14, units centi-seconds, used "to compensate for delays" in acting on program interrupt \#2, so as to increase the likelihood that the CDU angles for determining attitude rates will be sampled at uniform 0.1-second intervals. It is initialized in "REDAP" to 4, thus causing "RCSATT" (phase l) to be entered ( \(8-4=4 \mathrm{cs}\) ) after "T5PHASE2" is entered the first time, i.e. 10 cs after RHO initialized. The "nominal" contents at other times should be zero (it is reset to TIME5 after "RCSATT" (phase l) is entered).

T6LOC: See Digital Autopilot Interface Routines.
TAU (TAU \(\mathrm{T}_{\mathrm{O}}, \mathrm{TAU}_{1}, \mathrm{TAU}_{2}\) ): Single precision values of desired one-jet burn times to accomplish required rotations in roll, pitch, and yaw respectively, scale factor BlO, units centi-seconds.

THETADX (THETADX, THETADY, THETADZ): Single precision values, scale factor B-l, units revolutions, twos complement, of desired CDU angles in DAP, used to form the attitude errors for "JLOOP". Should not be confused with THETAD (components THETAD \({ }_{x}\) etc), which is a Major Variable.

TIME5, TIME6: See Digital Autopilot Interface Routines.
WBODY (WBODY \({ }_{O}\), WBODY \(_{1}\), WBODY \(_{2}\) ): Values of desired angular rates, scale factor B-3, units revolutions/deci-second, used to modify the rate error information in "JLOOP" if HOLDFLAG \(\neq 0\). Cells set in "NEWANGL" and "MANUSTOP" (to 0) to desired rates, and in "T5PHASE2" for RHC inputs. Also set in R6l. Cells OMEGAC for TVC.

XNDX1, XNDX2: Single precision index cells, scale factor Bl4, set at the start of "JETSLECT" to the complement of bits 8-7 (shifted right 6 places) of channel 31, the X-axis translation hand controller input. XNDX1 is the "AC Quad" translation index (reset 0 if XTRANS \(=1\), and used in conjunction with "pitch" information) and XNDX2 is the "BD Quad" translation index (reset 0 if XTRANS \(=-1\), and used in conjunction with "yaw" information).

XTRANS: See Digital Autopilot Interface Routines.
YINDEX: Single precision index parameter, scale factor Bl4, indicating the polarity of the yaw command desired: 0 if none, \(l\) if plus yaw, and 2 if minus yaw.

YMANNDX: See Digital Autopilot Interface Routines.
YNDX: Single precision index cell, scale factor B14, set at the start of "JETSLECT" to the complement of bits 10-9 (shifted right 8 places) of channel 31, the Y-axis translation hand controller input.

YWORDl, YWORD2: Single precision cells containing in bits 8-1 the yaw-command bits to be loaded in channel 5 when "T6START" is entered and after the yaw time duration has expired, respectively. The yaw time duration originally is in BLAST2+0.

ZNDX: Single precision index cell, scale factor B14, set at the start of "JETSLECT" to the complement of bits 12-11 (shifted right 10 places) of channel 3l, the Z-axis translation hand controller input.

\section*{Value of Jet Table Data}

Information on pitch and yaw jets is stored in \(K_{\text {pytabi }}\), where i is in the range \(0-14\). Bits \(12-11\) give the number 09 yaw jets used to perform the rotation, and bits 10-9 give the number of pitch jets used. Bits \(8-5\) give the yaw output bits (to be loaded in the corresponding bit positions of channel 5), while bits 4-l give the pitch output bits (to be loaded into the corresponding bits of channel 5). The value of \(i\) depends on the failure information (or, if no failures, the X-translation requested) as well as the rotation desired.
\[
\begin{aligned}
i & =3 \mathrm{a}+\mathrm{b} \\
\mathrm{a} & =0 \text { for no X-translation } \\
& =1 \text { for no failures, +X translation } \\
& =2 \text { for no failures, -X translation } \\
& =3 \text { for A (pitch) or B (yaw) failures } \\
& =4 \text { for C (pitch) or D (yaw) failures }
\end{aligned}
\]
\[
\begin{aligned}
\mathrm{b} & =0 \text { for no desired rotation } & & \text { (for PWORD2 and YWORD2, } \\
& =1 \text { for }+ \text { desired rotation } & & b=0 ; a=0 \text { if any } \\
& =2 \text { for - desired rotation } & & \text { failures) }
\end{aligned}
\]
\begin{tabular}{|c|c|c|c|c|c|}
\hline i & \(\mathrm{K}_{\text {pytab }}\) & \# of Yaw & Yaw Jet \# & \# of Pitch & Pitch Jet \# \\
\hline 0 & 00008 & 0 & --- & 0 & --- \\
\hline 1 & 51258 & 2 & 7,5 & 2 & 3,1 \\

\hline 7 & 7 & B & + Yaw & -X \\
\hline 8 & 6 & D & - Yaw & -X \\
\hline
\end{tabular}

Information on roll jets (for rotation combined with translation) is stored in \(K_{r t a b}\), where \(i\) is in the range \(0-14\). Bits \(14-12\) give the number of \({ }^{1}\) roll jets for using Quads B/D, while bits ll-9 give the number for using Quads \(A / C\) (the number in both cases is given by the value of the bits -2 , thus providing sign information). Bits 8-5 give the Quad A/C output (to be loaded into the corresponding bit positions of channel 6), while bits \(4-1\) give the Quad B/D output (likewise to be loaded into the corresponding bit positions of channel 6). The value of \(i\) is defined as for \(K_{p y t a b ;}\), except that \(Y\) translation is associated with Quad A/C and the Z translation with Quad B/D.
\begin{tabular}{|c|c|c|c|c|c|}
\hline i & \(\underline{\mathrm{K}_{\text {rtab }}}\) & \# of \(\mathrm{A} / \mathrm{C}\) & A/C Jet \# & \# of B/D & B/D Jet \# \\

\section*{Quantities in Computations}

See also list of major variables and list of routines
ldCONACC: See Digital Autopilot Interface Routines.
\(\mathrm{AK}_{\mathrm{O}}, \mathrm{AK}_{1}, \mathrm{AK}_{2}\) : See Digital Autopilot Interface Routines.
Cekprime : Single precision erasable memory constant, program notation radian, giving the "steer law gain" for LM-off (used in "TVCINITI" to initialize KPRIMEDT for "S40.8"). The maximum value that can be stored in the cell is \(\left(100 \times 2 \pi \times 2^{-5}\right)=(100 \pi / 16)\) radians \(/ \mathrm{sec}\) per radian, where "maximum value" actually is one least increment more than \(377778{ }^{\circ}\)
\({ }^{\text {Cekprime }}{ }_{1}\) : SEKPRIT precision erasable memory constant, program notation radian, giving the "steer law gain" set in "TVCINIT1" for LM-on (see \({ }^{C}\) ekprime \({ }_{0}\) and \(K_{\text {fkprimat }}\) ).

Cektlxdi : Single precision erasable memory constant, program notation 0 "EKTLXX/I", used in "TVCINIT1" to initialize KTLXdI for "S40.15" for the LM-off configuration. Scale factor is B4, units ASCREV/ \(\mathrm{sec}^{2}\), where one ASCREV \(=1.07975111\) revolutions (see K \({ }^{2}\) ). To convert to memory information, value in units of (l/sec 2 gctshould be divided by (1.07975111 x \(2^{4}\) ), giving a fraction which in turn is placed in the cell. Alternatively, cell could be considered scaled Bl8 in units of CDU actuator pulses per revolution times (newton-meters \(/ \mathrm{kg}\)-meters \({ }^{2}\) ), where second term compensates for the multiplication by IAVG/TLX (and reduces to \(1 / \mathrm{sec}^{2}\), of course). There are \(2^{14}\) actuator pulses in 1.07975111 revolutions.
\(C_{\text {ektlxdi }}\) : Single precision erasable memory constant, program notation 1 "EKTLX/I +1", used in "TVCINIT1" to initialize KTLXdI for "S40.15" for LM on (see also C ektlxdi \({ }_{2}\) ). Scale factor is B2, units ASCREV/sec \({ }^{2}\) (see Cektlxdio)
\({ }^{\text {C }}{ }_{\text {ektlxdi }}^{2}\) : Single precision erasable memory constant, program notation "S40.15" f8r "low bandwidth" LM on. Scale factor is B2, units ASCREV \(/ \sec ^{2}\left(\right.\) see \(\left.C_{\text {ektIxdi }}^{0}\right)\).

C erepfrac: Single precision erasable memory constant, program notation tialization for REPFRAC in "TVCINIT1" and "S40.8" (note that TS , i.e. REPFRAC, is doubled in "TEMPSET" if LM-off, hence effective "system" scale factor is B3).
\(C_{\text {erepfrac }}\) : Single precision erasable memory constant, program notation erepfrac \({ }_{1}\) "EREPFRAC +1 ", scale factor B2, used as LM-on initialization for REPFRAC in "TVCINIT1" and "S40.8". See also K frepfrac.
\(C_{h b n l 0} \quad(i=0-14):\) Set of single precision erasable memory constants i used in "TVCINITl" to initialize N1O for LM-on (if "SWICHOVR" entered, \(\mathrm{NlO}_{i}\) loaded with \(\mathrm{K}_{\mathrm{lbnlO}}^{i} 10\) instead).
i Notation Scale Factor
0 "HBNIO" BO
\(1 \quad\) "HBNII/2" Bl

2 "HBN12" BO
3 "HBDIl/2" Bl
4 "HBDI2" BO
5 "HBN2O" BO
6 "HBN21/2" BI
7 "HBN22" BO
8 "HBD2l/2" Bl
9 "HBD22" BO
10 "HBN3O" BO
11 "HBN31/2" Bl
12 "HBN32" BO
13 "HBD31/2" Bl
14 "HBD32" BO
CMDTMP: Value of required output information computed initially in "FWDFLTR" double precision, and subsequently rounded to single precision in "PITCHDAP" or "YAWDAP", scale factor BO, units ASCREV (or B14 in units of actuator pulses): VARK converts from units of revolutions in "FWDFLTR".
CNTR: Single precision counter, scale factor Bl4, units counts (of \(\frac{1}{2}\) second each), preset in "TVCINITl" and decremented in "ISHOTCHK". When reduced to 0, the next entrance to "TVCEXEC" causes a "one-shot" correction to PACTOFF and YACTOFF (as well as PDELOFF and YDELOFF), using \(K_{\text {fcorfac }}\). CNTR is set to +MAX in "S40.81"when the cutoff decisioncorfrag made, to inhibit further trim updates after that time (a value of -1 is set in "TEMPSET"/"CNTRCOPY" to signify that the one-shot correction has been made). Since \(K\) (initial condition for LM-on of CNTR) is zero, no decrementing of \({ }^{\text {corr }}\) I CNTR is required for that configuration.
COSCDUX, COSCDUZ: See Coordinate Transformations. Updated once a second while "CLOCKJOB" is entered, which includes period of time when TVC DAP is on.

DAP1, DAP2, DAP3: Filter quantities computed in "FWDFLTR", scale factor B-l, units revolutions. If LM off, then DAP3 is set equal to DAP2 (otherwise, it is derived), scaled B-3.
DAPDATRI: See Digital Autopilot Interface Routines.
DELBRTMP: Double precision erasable memory cell used to contained the updated value for DELPBAR or DELYBAR (for restart protection purposes), scale factor B14, units CDU actuator output pulses (or scale factor BO in ASCREV units).

DELOGA: Single precision value of roll attitude error used in "ONROLL", scale factor BO, units revolutions (computed initially in "ROLLDAP" as "distance from switch parabola").

DELOGART: Single precision value of roll attitude rate error used in "ONROLL", scale factor B-4, units revolutions/second.

DELPBAR: Double precision value of estimated "c.g. offset relative to electrical null" in pitch, scale factor Bl4 in units of CDU actuator pulses (or scale factor BO in ASCREV units). Initialized to PACTOFF in "TVCINITI" and updated in "PCOPY" with DELBRTMP (for restart protection purposes). After CNTR reduced to zero, used in "TEMPSET" to updated PDELOFF and PACTOFF (using \(K_{\text {for }}\) and then REPFRAC for weighting). Used in "SPSOFF" to load fcorfrac PACTOFF if suitable initialization completed (i.e. "TVCINITl" completed, initializing DELPBAR), and no thrust failure.
DELYBAR: Double precision value of estimated "c.g. offset relative to electrical null" in yaw, scale factor B14, units CDU actuator output pulses (or scale factor BO in ASCREV units). See DELPBAR (substitute yaw axis for pitch axis).
ERRBTMP: Value of pitch or yaw error in body coordinates, scale factor \(\mathrm{B}-1\), units revolutions, limited to K errim \({ }^{\circ}\) Could also be considered to be the "integral of body-axis raterrim err". Value is displayed on FDAI error needles (due to loading of \(\mathrm{AK}_{1}\) or \(\mathrm{AK}_{2}\) by appropriate copy routine). Loaded in "IGNITION" with RCS DAP pitch and yaw negative (single precision) error information for use in "TVCINITl", after limiting, to initialize PERRB and YERRB for LM-off.

Kldactsat: Single precision constant, program notation "I/ACTSAT", scale factor BO, octal value \(\mathrm{OOlO}_{8}\), corresponding to 0.003967285 . Effect in equations such as to cause an answer of one least increment ( \(2^{-14}\) in programmed equations) for an argument of 253 least increments or more (see \(K_{\text {actsat }}\) ).
\(K_{\text {ldattlim }}:\) Single precision constant, program notation "l/ATTLIM", scale factor BO, octal value \(0017 O_{g}\). Effect in equations such as to cause an answer of one least increment ( \(2^{-14}\) in programmed equations) for an argument of 137 least increments (at B-1 rev., about 1.505 ) : see \(K_{\text {attlim }}\).

K \({ }_{\text {lderrim }}\) : Single precision constant, program notation "l/ERRLIM", scale factor BO, octal value 00004 . Effect in equations such as to cause an answer of one least increment \(\left(2^{-14}\right.\) in programmed equations) for an argument of \(2^{-2}\) or more (see \(K_{\text {errim }}\) ): the \(2^{-2}\) would correspond to \(2^{-3}\) revolutions.

K \({ }_{\text {ldrtim }}\) : Single precision constant, program notation "l/RTLIM", scale factor BO, octal value 00115 g. Effect in equations such as to cause an answer of one least increment ( \(2^{-14}\) in programmed equations) for an argument of 213 least increments (at B-1 rev., about \(2.34^{\circ}\) ).

K latmxfir: Single precision constant, program notation "I/TMXFIR", scale factor \(B O\), octal value 000048 . Effect in equations such as to cause an answer of one least increment ( \(2^{-14}\) in programmed equations) for an argument of \(2^{-2}\) or more (see \(\left.K_{\text {tmxfir }}\right)\) : the \(2^{-2}\) would correspond to 2.56 seconds.
\(K_{4 c s d 2}\) : Single precision constant, program notation "BIT2", scale factor B14, units centi-seconds, giving the required time interval between DAP computations for different axes for LM-off. Value is \(2 \times 2^{-14}\), corresponding to 2 centi-seconds: this gives a time interval of 4 centi-seconds from one pitch axis solution to the next.
\(K_{\text {8csd2 }}\) : Single precision constant, program notation "BIT3", scale factor \({ }^{\text {B14 }}\), units centi-seconds, giving the required time interval between DAP computations for different axes for LM-on. Value is \(4 \times 2^{-14}\), corresponding to 4 centi-seconds: this gives a time interval of 8 ' centi-seconds from one pitch axis solution to the next.
\(K_{\text {actsat }}\) : Single precision constant, program notation "ACTSAT", scale factor \(B 14\), units CDU actuator output pulses (one pulse is 85.41 seconds). Value is \(253 \times 2^{-14}\), corresponding to about \(6.0024^{\circ}\). Note that \(2^{14}\) CDU actuator output pulses correspond to about l.079751ll revolutions; there are about 42.14963 pulses/degree.
\(K_{\text {attlim }}\) : Single precision constant, program notation "ATTLIM", scale factor \(B-1\), units revolutions. Value is 136 least increments (see \(K_{\text {ldattlim }}\) ), or octal \(00210_{g}\), corresponding to about \(1.494^{\circ}\).
\(K_{\text {csmnlo, }}(i=0-14)\) : Set of single precision constants used in "TVCINITl" csmnlO \(i\) to initialize N1O for LM-off, program notation ( \(i=0\) ) "CSMN1O". Only values for \(i=0^{1}-9\) are significant (since \(\mathrm{NlO}_{10}\) to \(\mathrm{NlO}_{14}\) are employed only for LM-on); values for \(i=10-14\) are the same cells as \(\mathrm{K}_{\mathrm{LbnlO}}^{\mathrm{O}}\) (o \(\mathrm{K}_{\mathrm{IbnlO}_{4}}\).
\begin{tabular}{|c|c|c|c|c|c|}
\hline \(\underline{\text { i }}\) & Nominal Value & Scale Factor & Nominal & True Value & Stored \\
\hline 0 & 0.99999 & B0 & 0.99999 & (N10) & 0.99994 \\
\hline 1 & -0.2549 & Bl & -0.5098 & (N11) & -0.50977 \\

\hline 9 & 0.0 & B0 & 0.0 & (D22) & 0.0 \\
\hline
\end{tabular}

The "nominal value" is the scaled decimal input to the assembly program; the "stored" value was obtained by converting the octal memory information to decimal and applying the proper scale factor.
\(\mathrm{K}_{\mathrm{db}}\) : Single precision constant, program notation "DB", scale factor BO, units revolutions, giving roll deadband for TVC DAP. Octal value is 00344 , corresponding to about \(5.0098^{\circ}\).
\(K_{\text {emat }}\) : Single precision constant, program notation " \(\mathrm{E}(-\mathrm{AT})\) ", scale factor BO , value 37535 g , corresponding to ( \(1-\mathrm{K}_{\text {onemeat }}\) ).
Kerrim: Single precision constant, program notation "ERRLIM", scale factor B-l, units revolutions. Value is \(10000_{8}\), corresponding to \(2^{-3}\) revolutions or \(45^{\circ}\).
\(K_{\text {fcorfrac }}\) : Single precision constant, program notation "FCORFRAC", scale factor B2. Used in "TEMPSET" as the LM-on c.g. one-shot correction gain (see CNTR above). A value of 2 K . is used for LM-off (hence scale factor could be considered B3 for fenc LM-off application). Value is octal 10000 , corresponding to \(1.0 \times 2^{-2}\), where first term is equation value and second is scale factor.
\(K_{\text {fkprimdt }}\) : Single precision constant, program notation "FKPRIMDT", scale factor B-4, units (revolutions/DAP cycle) per radian. Used in "SWICHOVR" to load KPRIMEDT. Value is 0.0102, corresponding approximately to \(0.05 \times 0.08 \times(1 / 2 \pi) \times 2^{4}\), where first term is value of gain in (radians/sec)/radian, second is DAP cycle rate in seconds, third is conversion to revolutions, and 4th is scale factor: see KPRIMEDT.
\(K_{\text {frepfrac }}\) : Single precision constant, program notation "FREPFRAC", scale factor B2, used in "SWICHOVR" and "S40.8" to load REPFRAC for "low-bandwidth" mode of TVC DAP. Nominal value is \(0.0375 \times 2^{-2}\), where first term is equation value and second is scale factor. The actual stored value corresponds to about 0.0376 .
\(K_{\text {intercp }}\) : Single precision constant, program notation "INTERCEP", scale factor B-3, units revolutions. Octal value is \(00510_{8}\), corresponding to about \(0.2002 \times 45=0.9009^{\circ}\).
\(K_{\text {IbnlO }}\) ( \(i=0-14\) ): Set of single precision constants used in "SWICHOVR" ( \(i=0\) to \(\operatorname{initialize~} \mathrm{NLBNIO}\) i for "low bandwidth" LM-on, program notation
\begin{tabular}{|c|c|c|c|c|c|}
\hline \(\underline{\text { i }}\) & Nominal Value & Scale Factor & Nomina & True Value & Stored \\
\hline 0 & 0.99999 & B0 & 0.99999 & (N10) & 0.99994 \\
\hline 1 & -0.3285 & Bl & -0.6570 & (N11) & -0.65698 \\
\hline 2 & -0.3301 & B0 & -0.3301 & (N12) & -0.33008 \\

\hline 13 & -0.9558 & B1 & -1.9116 & (D31) & -1.91162 \\
\hline 14 & 0.9372 & BO & 0.9372 & (D32) & 0.93719 \\
\hline
\end{tabular}

See note with \(K_{c s m n l 0}{ }_{i}\).
\(K_{\text {maxim }}\) : Single precision constant, program notation "MAXIIM", scale factor B-4, units revolutions/second. Value is \(0.01388889 \times 2^{4}\), corresponding to about 5 degrees/second.
\(K_{\text {mcrat }}\) : Single precision constant, program notation "LMCRATE", scale factor B-4, units revolutions/second (gives limit cycle roll rate for TVC roll DAP). Value is \(00111_{g}\), corresponding to about 0.10025 degree/second.
\(K_{\text {minim }}\) : Single precision constant, program notation "MINLIM", scale factor B-4, units revolutions/second. Value is \(0.00277778 \times 2^{4}\), corresponding to about 1 degree/second.
\(K_{\text {mrol }}\) : Single precision constant, program notation "-ROLLI", octal value 00012 , corresponding to channel 6 roll jets \#10 and \#12, giving a \(S^{8}\) negative roll using quad \(B / D\).
\(K_{\text {mro2 }}\) : Single precision constant, program notation "-ROLL2", octal value 00240 , corresponding to channel 6 roll jets \#14 and \#16, giving a \(S^{\circ}\) negative roll using quad \(A / C\).
\(K_{\text {msope }}\) : Single precision constant, program notation "-SLOPE", scale factor BO, units (revolutions/second)/revolution. Value is 0.2. Notation arises from fact that "true" slope is negative (an increasing attitude error results in a decreasing attitude rate).
\(K_{o n e m e a t}\) : Single precision constant, program notation "l-E(-AT)", scale factor BO, octal value 00243 g . Value corresponds to \(163 / 16384\), or approximately 0.01 , equivalent to the first term in the series expansion of ( \(1-e^{-a t}\) ) for at \(=0.01\).
\(K_{\text {prol }}\) : Single precision constant, program notation "+ROLLl", octal value \(00005_{8}\), corresponding to channel 6 roll jets \#11 and \#9, giving a + Roll (for SM). Uses Quad B/D.
\(K_{\text {pro2 }}\) : Single precision constant, program notation "+ROLL2", octal value \(00120_{8}\), corresponding to channel 6 roll jets \#15 and \#13, giving a + Roll (for SM). Uses Quad A/C.
\(K_{\text {rrt }}\) : Single precision constant, program notation "BIT5", scale factor Bll, value \(2^{-10}\), corresponding to \(2 \times 2^{-11}\), where first term is conversion of rate to units of revolutions/second, and second is scale factor.
\(K_{\text {t6sc }}\) : Single precision constant, program notation "T6SCALE", scale factor B 7 , value \(31000_{8}\). Value corresponds to \(100 \times 2^{-7}\), where first term converts from seconds to centi-seconds and second is scale factor.
\(K_{\text {tcorr }}\) : Single precision constant, program notation "TCORR", scale factor \(\mathrm{r}_{\mathrm{O}} \mathrm{B1} 4\), units counts (used as a preset for CNTR in "TVCINIT1" for LM-off). Value is \(5 \times 2^{-14}\), meaning that the "single-shot" correction will take place the 6th time that "TVCEXEC" is entered, or about 3.43 seconds after "IGNITION" is done.
\(K_{\text {tcorr }}\) : Single precision constant, program notation "TCORR +1", scale lfactor B14, units counts (used as a preset for CNTR in "TVCINIT1" for LM-on). Value is 0, meaning that the "single-shot" correction will take place the first time that "TVCEXEC" is entered, or about 0.93 seconds after "IGNITION" is done.
\(K_{\text {tminfr }}\) : Single precision constant, program notation "TMINFIRE", scale factor B10, units centi-seconds. Value is 00030 , corresponding to 1.5 centi-seconds (i.e. 15 milliseconds \({ }^{\circ}\).
\(K_{\text {tmxfir }}\) : Single precision constant, program notation "TMAXFIRE" scale factor B10, units centi-seconds. Value is \(250 \times 2^{-10}\), corresponding to 250 centi-seconds (i.e. 2.5 seconds). See \(K_{\text {Idtmxfir }}\) 。
KPRIMEDT: Quantity used in "S40.8" to convert guidance attitude error information into OMEGAC. Scale factor is B-4, units (revolutions/ DAP cycle) per radian. Loaded in "TVCINIT1" and "SWICHOVR". Least significant half expected to be 0 (from "TVCINIT1" loading method).

KTLXdI: Single precision value of appropriate C
"TVCINITl" or "SWICHOVR" and used in "S40. \({ }^{5} \dagger\) Indi cell, loaded in
Scale factor is B4 (LM off) or B2 (LM on), program notation "KTLX/I".

MCDUYDOT, MCDUZDOT: Complement of change in CDU and CDU respectively since previous sample, scale factor B-l, units revolutions/DAP cycle (in general). Computed in "PITCHDAP" and "YAWDAP" based on separate CDU angle samples, and used to compute appropriate component of OMEGAB. If the magnitude exceeds about \(2.33^{\circ}\), it is set 0 (see K \({ }_{\text {ldrtim }}\) ). The DAP cycle is 40 ms for LM-off and 80 ms for LM-on. Due to initialization in "DAPINIT", the rate derived the first pass through "YAWDAP" will be \(50 \%\) too big.
\(\mathrm{NIO}_{i}(i=0-14):\) Set of filter constants loaded in "TVCINIT1" with \(K_{\text {csml0 }}\) (LM-off) or \(\mathrm{C}_{\text {hbnlo }}\) (LM-on), or in "SWICHOVR" with \(K_{\text {lbnlo }}\). For \(L^{\dot{I}_{o f f}}\), parameters for \(^{i_{i}}=10-14\) are not used. Scale factors for \(i=1,3 ; 6,8\); and 11, 13 are Bl, with remainder of constants (all single precision) having scale factor BO.

OGA: Single precision value of roll error (OGANOW - OGAD), scale factor BO, units revolutions, computed in "TVCEXEC". Program notation where computed is "OGAERR".

OGAD: Single precision value of desired outer gimbal angle (i.e. CDU \({ }^{\text {) }}\) ), scale factor \(B-1\), units revolutions, set to CDU in "IGNITION" \(x\) (when SPS engine is turned on). Used to cause the roll TVC DAP to maintain "roll attitude hold".
OGANOW: Single precision value of CDU, scale factor B-l, units revolutions, sampled in "TVCINITX"

OGAPAST: Previous value of OGANOW, scale factor B-1, units revolutions, loaded with previous value of OGANOW in "TVCEXEC".

OGARATE: Single precision value of rate of change of OGANOW computed at the start of "ROLLDAP", scale factor B-4, units revolutions/second. Will be about \(2 \%\) too big the evaluation after "TVCINIT4" is performed (since delay between successive samples then is 0.51 seconds, not 0.50 seconds).

OMEGAB: Value of body rate determined from first difference of \(C^{C D U}\) and \(C_{z}\) information, scale factor B-l, units revolutions/DAP cycle (colyputed double precision). The y component is loaded in "PITCHDAP" and the z component in "YAWDAP", program notations "OMEGAYB" and "OMEGAZB" respectively. The "x" component is used for the storage of OGARATE (single precision), and is assigned that tag. The cells used for OMEGAB are used in the RCS DAP for ADOT (a common cell assignment is made for telemetry considerations). Note that "X" component is \(B-4 \mathrm{rev} / \mathrm{second}\), not B-l rev/DAP cycle, and single precision.

OMEGAC: Value of guidance steering output computed in "S4O.8", scale factor B-l, units revolutions/DAP cycle (see KPRIMEDT). The \(x\) component is not used; the \(y\) component is used in "PITCHDAP"; and the z component is used in "YAWDAP".

PACTOFF: Single precision value of pitch c.g. offset, scale factor B14, units CDU actuator pulses (one pulse is 85.41 seconds). Could also be considered scaled BO .in units of ASCREV (see Cektlxdi). Can be loaded by Rl of N 48 (e.g. in RO3). It is measured \({ }^{\text {end }}\) "relative to electrical null" specified by K Computations). Quantity also called "total pitas trim angle." It is used in "TVCINITl" to initialize filter quantities in TVC DAP, and is updated in "TEMPSET" after the one-shot has taken place (CNTR reduced to 0). Can also be updated in "SPSOFF" (see DELPBAR).
PCDUYPST, PCDUZPST: Previous values of CDU and CDU for use in deriving MCDUYDOT and MCDUZDOT for pitch DAP, Single prêcision with scale factor B-1, units revolutions, in twos complement. Separate cells are used for yaw DAP (see YCDUYPST). PCDUiPST cells are initialized in "DAPINIT", with "PITCHDAP" entered at a time corresponding to one complete DAP cycle (pitch and yaw) later, giving proper firstdifference computation.

PCMD: Single precision value of previous pitch output command information, scale factor B14, units CDU actuator pulses (or BO in units of ASCREV). It is intended to maintain an image of the information in the optics error counter driven from TVCPITCH output. It is set to PACTOFF in "TVCINIT1" ("S40.6" left engine bell at that position), and updated in "PCOPY" with CMDTMP.

PDELOFF: Value of pitch c.g. offset, scale factor B14, units CDU actuator pulses (or BO in units of ASCREV). The quantity is a double precision version of PACTOFF (updated in "TEMPSET" and initialized to PACTOFF in "TVCINITI") used to minimize the effect of computer word length.
PERRB: Value of pitch error in body coordinates, loaded in "PCOPY" with ERRBTMP (which in turn is sum of previous PERRB and (OMEGAC OMEGAB \({ }_{\mathrm{y}}\) )), scale factor \(B-1\), units revolutions. Could also \({ }^{\mathrm{y}}\) be considered to be the "integral of body-axis pitch-rate error", since the OMEGAi \(y\) terms are in units of revolutions/DAP cycle.

PHASETMP: Single precision cell used in "SWICHOVR" to retain the value of TVCPHASE until the computation is complete, to permit setting of TVCPHASE \(=-2\) as an indication to restart logic ("REDOTVC" and "CMDSOUT") that "SWICHOVR" was being performed.

PTMPi (i = 1 - 6): Values of pitch filtered information, initialized to 0 in "TVCDAPON" and "SWICHOVR", and loaded with TMPi in "PCOPY". Scale factors are all B-1, units revolutions.

RATDES: Single precision value of desired roll rate used in "ROLLSET", scale factor B-4, units revolutions/second. Program uses TEMREG cell.

RCSFLAGS: See Digital Autopilot Interface Routines.

REPFRAC: Single precision value of "repetitive c.g. correction fraction", scale factor B2, used in "1SHOTCHK" to control update of the c.g. tracker (if REPFRAC 0 or negative, no update is done) after CNTR becomes 0. It is initialized in "TVCINIT1" to appropriate C and (for "long" burns) is loaded in "S40.8" with the same erepfrac information. If "SWICHOVR" entered, loaded with K \({ }_{\text {frepfrac. }}\). In "S40.8", is set to -0 if thrust below minimum value, to inhiffelrapdates.
ROLLFIRE: Single precision cell, scale factor BO, set to + MAX for positive roll torque and -MAX for negative roll torque in roll TVC DAP. It is initialized to 0 in "TVCDAPON" and when roll jets are turned off in "NOROLL" or "NOROLLI", and used as a control cell to indicate that roll jet firings have been specified (used at start of "ROLLDAP", with TEMREG, to force at least \(\frac{1}{2}\) second of no firing between successive firings).

ROLLWORD: Single precision cell initialized to 0 in "TVCDAPON" and used to permit alternation of the pairs of jets (i.e. quads) used for torque in the TVC roll DAP. Bit l is used for positive roll commands and bit 2 for negative roll commands: quad \(B / D\) is used if the bit is now 0 and quad \(A / C\) if bit is now l. The bit used for selection is complemented after being used.

SGNDOG: Cell giving sign information for DELOGA (implemented in program by loading a "clear add" order for positive and a "clear subtract" order for negative), program notation "I". It is set 0 in "ROLLSET" if the polarity of the present jet firing is the same as that of desired firing during this evaluation, in order to flag the fact that present jets should be continued (subsequent evaluations can reduce the required roll firing time, but not increase it, due to logic at end of "ROLLSET").

SGNRT: Single precision cell, scale factor Bl4, giving information on the polarity of OGARATE.

SINCDUX: See Coordinate Transformations (and COSCDUX).
T5LOC: See Digital Autopilot Interface Routines.
T5TVCDT: Single precision value of required setting for TIME5, scale factor B14, units centi-seconds. TIME5 is incremented by hardware means once each centi-second, and when it reaches 16384 ( \(2^{14}\) ), program interrupt \#2 is generated. Consequently, to cause program interrupt \#2 in 2 centi-seconds from "now", TIME5 is set to 16384 \(2=16382\); in 4 centi-seconds requires 16380; etc.

T6LOC: See Digital Autopilot Interface Routines.
TEMREG: Single precision cell used for several functions within TVC roll DAP, but left at end with value of time loaded into TIME6, scale factor B10, units centi-seconds. It is preset to 0 in "TVCDAPON", and used with ROLLFIRE at the start of "ROLIDAP" to force at least \(\frac{1}{2}\) second of no firing between successive firings.

TIME5: See Digital Autopilot Interface Routines.
TIME6: See Digital Autopilot Interface Routines.
TMPi (i=1-6): Set of cells used to retain PTMPi or YTMPi information, scale factor \(B-1\), units revolutions, in order to achieve restart protection and allow use of the common subroutines "FWDFLTR" and "PRECOMP". All cells double precision.

TTMP1: Double precision cell used for intermediate storage of quantities in TVC DAP (not shown in programmed equations), set 0 in "TVCDAPON" (no functional purpose served by the zeroing).

TVCDUMMY: Single precision cell set 0 in "TVCDAPON", but not otherwise referenced by TVC DAP (cell formerly assigned to a stroking-test variable, and employed for erasable memory layout considerations).

TVCEXPHS: Single precision cell, scale factor B14, used to control the restart logic associated with the TVC DAP for the waitlist task started every half second at "TVCEXEC". It is initialized to 0 in "IGNITION" and at the end of each performance of the "TVCEXEC" task. If it is non-zero when "REDOTVC" is entered, it is used as an indexing parameter to select the appropriate address within the "TVCEXEC" package in "EXRSTRT". For clarity, these addresses are not shown in the programmed equations, but correspond to the line following the one which incremented TVCEXPHS to its present value.

TVCPHASE: Single precision cell, scale factor B14, used to control the restart logic associated with the TVC DAP for the initialization, switchover to low bandwidth (IM-on), pitch copy cycle, and yaw copy cycle (values \(-1,-2,+1\), and +3 respectively). Set to -1 in "IGNITION" and to 0 at the start of "TVCINIT4", to control branching in "REDOTVC". If "SWICHOVR" entered, set to -2 , after the present value saved in PHASETMP. The appropriate "PCOPY"/"YCOPY" routine sets to control the pitch/yaw copy cycle restart logic.

TVCPITCH, TVCYAW: See Digital Autopilot Interface Routines.
VARK: Single precision variable gain for TVC pitch and yaw channels, scale factor B4 (LM off) or B2 (LM on), units ASCREV/revolution (or B18/B16 in units of CDU actuator pulses/revolution). It is computed in "S4O.15" and used in "FWDFLTR".

VCNTR: Single precision cell, scale factor B14, used for control of the "TVCEXEC" computations. It is normally employed to cause an update of DAP parameters (due to mass change computed every 2 seconds in "S40.8") every 20 entrances to "TVCEXEC" (i.e. every 10 seconds). Since the modifications to the counter are not restart protected, however, a restart in a small interval could cause another modification to the counter (modifying the period, although this should not be a problem). The cell is preset to 19 in "TVCINIT1" and in "TVCEXEC" after updating parameters (when cell reaches +0 ).

YACTOFF: Single precision value of yaw c.g. offset, scale factor B14, units CDU actuator pulses (or scale BO in ASCREV). It is measured "relative to electrical null" specified by K (sbias Steering Computations). See PACTOFF above (updated atbias analogous times to those for PACTOFF, but of course with yaw parameters).
YCDUYPST, YCDUZPST: Previous values of CDU and CDU for use in deriving MCDUYDOT and MCDUZDOT for yaw DAP, single precỉsion with scale factor B-l, units revolutions, in twos complement. Separate cells are used for pitch DAP (see PCDUYPST). YCDUiPST cells are initialized in "DAPINIT", but "YAWDAP" is entered for the first time at a time corresponding to 1.5 complete DAP cycles (i.e. pitch and yaw, plus pitch), giving a derived rate for this first pass (at DAP turn-on or after a restart) that is \(50 \%\) too big.

YCMD: Single precision value of previous yaw output command information, scale factor Bl4, units CDU actuator pulses (or BO in units of ASCREV). See PCMD.

YDELOFF: Value of yaw c.g. offset, scale factor B14, units CDU actuator pulses (or BO in units of ASCREV). Quantity is a double precision version of YACTOFF (cf. PDELOFF).

YERRB: Value of yaw error in body coordinates, loaded in "Y COPY" with ERRBTMP (which in turn is sum of previous YERRB and (OMEGAC \(\mathrm{OMFGAB}_{\mathrm{z}}\) )), scale factor \(\mathrm{B}-1\), units revolutions ( cf . PERRB). \({ }^{2}\)

YTMPi (i = l - 6) : Values of yaw filtered information, initialized to 0 in "TVCDAPON" and "SWICHOVR", and loaded with TMPi in "YCOPY". Scale factors are all B-l, units revolutions.

CM/POSE (Entered by setting AVEGEXIT = "CM/POSE" in "P62")

\section*{Quantities in Computations}

See also list of major variables and list of routines

Al: Value of drag (set to D or AO in "HUNTEST") used to compute FACTOR, scale factor \(\mathrm{BO}, \mathrm{G}\)-units ( 25 g 's).

AHOOKDV: Term in GAMMAL calculation (equal to AHOOK DVL), scale factor B4.

AIGdPIP: See General Program Control.
ALFAdl80: Single precision angle, program notation "ALFA/l80", giving the third Euler angle of the CM attitude (about UBY in "pitch"), scale factor B-l, units revolutions.

ALFAdPIP: See General Program Control.
ALP: Quantity used to compute VREF in "UPCONTRL" (and computed itself in "HUNTESTl", where it is also used), scale factor BO.

ALPHAV: See Coordinate Transformations.
ALT: See Display Computations: discussion concerning loading with DELVLVC \({ }_{x}\) also applicable to "STARTEN1".

AMGdPIP: See General Program Control.
AO: Initial drag for "UPCONTRL", scale factor BO, G-units (25 g's).
AOGdPIP: See General Program Control.
ASKEP: Value of "Kepler range", scale factor BO, units revolutions, stored in push-down list location OD. A single precision value is available in the ASKEP cell itself for generating telemetry data.

ASPl: Value of "final phase" range, scale factor BO, units revolutions, stored in push-down list location 2D. A single precision value is available in the ASPI cell itself for generating telemetry data.

ASP3: Value of "gamma correction", scale factor BO, units revolutions.
ASPDWN: Value of "range down to pull-up", scale factor BO, units revolutions, stored in push-down list location 6D. A single precision value is available in the ASPDWN cell itself for generating telemetry data.

ASPSpTMp: "Vector" information loaded for telemetry purposes (see "RĀNGER" for format). Cells loaded are the same as those used for WBODY (RCS DAP) and OMEGAC (TVC DAP); program notation "ASPS (TM)".

ASPUP: Value of "up-range", scale factor BO, units revolutions, stored in push-down list location 4D. A single precision value is available in the ASPUP cell itself for generating telemetry data.

AVEGEXIT: See General Program Control.
BFTAdl80: Single precision angle, program notation "BBETA/180", giving the second Euler angle of the CM attitude (about UXA * UBY in "yaw"), scale factor I3-1, units revolutions.

BETAdPIP: See General Program Control.
Cadpad: Single precision erasable memory constant, program notation "LADPAD", scale factor BO, used to initialize LAD in "STARTENT".

Codpad: Single precision erasable memory constant, program notation "LODPAD", scale factor BO, used to initialize LOD in "STARTENT".
\(\underline{C}_{\text {unitw }}\) : See General Program Control.
CdDO: Value of \(K_{\text {cone }} / \mathrm{DO}\), computed in "INITROLL" and used in "CONSTD", scale factor B6.

COSG: Approximation to value of cos GAMMAL, scale factor B.l.
COSTI: See Coordinate Transformations.
CPE: Value of eccentricity, scale factor B2 (stored in push-down list).
CPX: Value of intermediate quantity used in "GLIMITER", scale factor F3l, V-units (see NV).

CPY: Value of lateral miss limit, scale factor B2, units of radians.
D: Value of total acceleration, scale factor BO, G-units ( \(25 \mathrm{~g}^{\prime} \mathrm{s}\) ).

DELVLVC: See Burn Control (and ALT).
DELVREF: See General Program Control.
DHOOK: Quantity used in computation of GAMMAL, scale factor BO.
DIFF: Difference between predicted and actual expected range, scale factor \(B O\), units revolutions. Note that polarity of program definition is the reverse of that in official equation documentation.

DIFFOLD: Previous value of DIFF, scale factor BO, units revolutions.
DIEWD: Computed desired change in LEWD, scale factor BO.

DNRNGERR: Difference between predicted angle of travel and actual angle to target (i.e. PREDANG - THETAH) computed in "PREDICT3", scale factor BO, units revolutions, provided that bit 10(GONEPAST) of FLAGWRD6 \(=0\). If bit is set 1 , DNRNGERR is set to \(K_{\text {maxrng }}\) (and
not subsequently loaded) in P67.

DO: Value of "controlled constant D", scale factor BO, G-units ( \(25 \mathrm{~g} \mathrm{~s}^{\mathrm{s}}\) ).

DREFRV: Value of \(K_{\text {aref }}\) table for present \(N V\), same scaling as \(K_{\text {aref }}\).
DTEAROT: See Coordinate Transformations.
DVL: Value of (VSI - VL), scale factor Bl, V-units (see NV).
ENTRYVN: Single precision cell loaded with verb-noun pattern (in proper format) for use in "ENDEXIT" for entry display.

FlV: Value of \(K_{d r d a}\) table for present \(N V\), same scaling as \(K_{d r d a}\).
F2V: Value of \(K_{d r d d}\) table for present \(N V\), same scaling as \(K_{d r d d}\).
F3V: Value of \(K_{d r d}\) table for present \(N V\), same scaling as \(K_{d r d}\).
FACTl: Value of quantity computed in "HUNTESTI", scale factor Bl, V-units (see NV).

FACT2: Value of quantity computed in "HUNTESTl", scale factor BO.
FACTOR: Quantity used in "UPCONTRL" (initialized to 1 in "STARTENT"), scale factor BO.

GAMA: Single precision angle computed in "CM/POSE", scale factor BO, units revolutions, used to compute (by forming first difference with previous value) GAMDOT.

GAMDOT: Rate of change of GAMA per 0.1 second, scale factor B-l, units revolutions. Set to zero if magnitude is less than \(K_{g m m n}\).
GAMMAL: Value of "flight path angle at VL", scale factor BO, units radians.

GAMMALI: Value of "simple form of GAMMAL", scale factor BO, units radians. Stored in push-down list location 22 D .

GOTOADDR: Single precision cell used to contain the starting address of the computations performed after "SCALEPOP" is performed, and used to control the phases of the entry computations. Prior to start of entry computations, used as storage for return address information.

GRAD: Single precision "gradient" of present velocity with respect to a table value, scale factor BO, used to permit linear interpolation in "PREDICT3".

HEADSUP: See Entry Preparation.
dJ: Single precision indexing parameter used in "PREDICT3", scale dactor B14. It is incremented by 13 to select the next set of tabular information within an index loop (the incrementing is shown because the quant, ty is on the downlink).
\(K_{\text {ldgmx }}\) : Constant, program notation "I/GMAX", scale factor B-2, units
\({ }^{1}\) ldgmx of \(g^{-1}\). Value is 0.5 , corresponding to \((1 / 8) \times 2^{2}\), where first term is reciprocal of "GMAX" and second is scale factor.
\(K_{1 d k L_{4}}\) : Constant, program notation "l/K44", scale factor B-1, units of ( \(1 / V\)-units). Stored value is 0.00260929464 , corresponding to \((1 / 19749550) \times 25766.1973 \times 2^{1}\), where first term is reciprocal of "K4/4" (in units of fps), second is V-unit conversion, and third js scale factor.
\(K_{\text {ldkal }}\) : Constant, program notation "l/KAl", scale factor B6, units of G-units ( \(25 \mathrm{~g}^{\prime} \mathrm{s}\) ) reciprocal. Value is 0.30048077 , corresponding to ( \(1 / 1.3\) ) \(\times 25 \times 2^{-6}\), where first term is reciprocal of "KA.l" (in unjts of g's), second is G-unit conversion, and third is the scale factor.
\(K_{l d k b}\) : Constant, program notation "l/KBl", scale factor BO , value 0.400. Value corresponds to \((1 / 2.5)\), or the reciprocal of the value of "KBl".
\(K_{2 c h s}\) : Constant, program notation "2ClHS"; scale factor B2, value 0.0215983264 . Value corresponds to \(2 \times(1.25) \times 28500 \times 805\) \(\times(25766.1973)^{-2} \times 2^{-2}\), where first term is equation factor of 2, second is value of Cl, third is value of HS , fourth converts answer from fps2 to \(G\)-units (of \(25 \mathrm{~g}^{\prime} \mathrm{s}\) @ \(32.2 \mathrm{fps}^{2}=805 \mathrm{fps}^{2}\) ), fifth converts velocity to fps from V-units, and sixth is scale factor.
\(K_{2 h s}\) : Constant, program notation "2HS", scale factor B2, value 0.0172786611. Value corresponds to 2 x 28500 x 805 x (25766.19r73) \({ }^{-2} \times 2^{-2}\), where terms (except for the omission of the 1.25 factor for CI) have analogous significance to those for \(K_{2 c h s}\).
\(K_{2 h s g m x q}:\) Constant, program notation "2HSGMXSQ", scale factor B4, value \(3.05717 E-5\). Value corresponds to the square of: \(\left(2 \times 28500 \times 8 \times 32.2 \times(25766.1973)^{-2} \times 2^{-2}\right)\), where first term is equatior factor of 2 , second is value of HS , third is value of GMAX (in g's), fourth converts GMAX to fps \({ }^{2}\), fifth converts \(V\)-units to fps, and sixth is square root of scale factor.
\(K_{25 \mathrm{~nm}}\) : Constant, program notation \({ }^{\prime 2} 25 \mathrm{NM}^{\prime \prime}\), scale factor BO , units revolutions. Value is 0.0011574074 , corresponding to 25 x (1/21600), where first term is "basic" value and second converts from nmi to revolutions (it is the reciprocal of \(3437.7468 \times 2 \pi\), or \(60 \times 360\) for \(60 \mathrm{nmi} /\) degree).
\(K_{500 \text { sec }}\) : Constant, program notation "500SEC" \({ }^{\text {scale factor B28, units }}\) centi-seconds. Value is \(50000 \times 2^{-28}\), corresponding to 500 seconds.
\(K_{\text {aref }}\) : Single precision set of constants, scale factor BO, G-units (of 25 g 's ). To convert to \(\mathrm{fps}^{2}\), multiply table entries by \(32.2 \times 25=805\). Table starts at "VREFER +65". See below.
\(K_{\text {atbias }}\) : Constant, program notation "LATBIAS", scale factor B2, value 0.00003 , units radians. Corresponds to 0.00012 radians, or (multiplying by 3437.7468 ) 0.412529616 nmi.
\(K_{\text {atspe }}\) : Constant, program notation "LATSLOPE", scale factor B-1, value 0.083333 . Value corresponds to (1/12) \(\times 2^{-1}\), or ( \(1 / 24\) ).
\(K_{c 12}\) : Constant, program notation "C12", scale factor B-5, value 0.00684572901 . Value corresponds to 28500 x (1/21 202 900) x ( \(1 / 2 \pi\) ) \(\times 2^{5}\), where first term is HS, second is reciprocal of RE in feet (standard "entry radius"), third converts from radians to revolutions, and fourth is scale factor.
\(K_{c 18}\) : Constant, program notation "C18", scale factor Bl, V-units (see NV). Value is 0.0097026346 , corresponding to 500 x (1/25766.1973) \(\times 2^{-1}\), where first term is "basic" value (in fps), second converts to V-units, and third is scale factor.
\(\mathrm{K}_{\mathrm{C} 2 \mathrm{O}}\) : Constant, program notation "C2O", scale factor BO, G-units (of 25 g 's). Value is 0.26086957 , corresponding to 210 x (1/805), where first term is "basic" value (in \(f p s^{2}\) ), and second is conversion to G-units.
\(K_{\text {c21 }}\) : Constant, program notation "C21", scale factor BO, G-units (of 25 g 's). Value is 0.17391304 , corresponding to 140 x (1/805), where first term is "basic" value (in \(f \mathrm{ps}^{2}\) ), and second is conversion to G-units.
\(K_{\text {chk }}\) : Constant, program notation "CHOOK", scale factor B4, value \(2^{-6}\), corresponding to \(0.25 \times 2^{-4}\), where first term is "basic" value and second is scale factor.
\(K_{\text {chone }}\) : Constant, program notation "CHl", scale factor B-4, value \(0.32 \times 2^{\perp}\). Value corresponds to \(1.0 \times(1 / 25) \times 2^{4}\), where first term is the "basic" value, second converts to G-units, and third is scale factor.
\(K_{\text {cone }}\) : Constant, program notation "COO1", scale factor B6, value -0.000625 . Value corresponds to ( -1 ) \(\times(1 / 25) \times 2^{-6}\), where first term is "basic" value, second converts to G-units, and third is scale factor.
\(K_{c s l 5}{ }^{2}\) : Constant, program notation "COS15", scale factor BO, value 0.965 . Value corresponds to cosine 15.2 degrees.
\(K_{d l e w d O}\) Constant, program notation "DLEWDO", scale factor BO, value -0.05.
\(K_{d r d}\) : Single precision set of constants, scale factor B-3, units revolutions. Multiply table entries by \(21600 \times 2^{-3}=2700\) to convert to nmi. Table starts at "VREFER +78". See below.
\(K_{d r d a}\) : Single precision set of constants, scale factor B-3, units revolutions/C-unit. Multiply table entries by 2700/805 to convert to units of nmi/fps \({ }^{2}\). Table starts at "VREFER +13 ". See below.
\(K_{d r d d}\) : Single precision set of constants, scale factor B-l, units revolutions/V-unit. Multiply table entries by 10800/25766.1973 to convert to units of nmi/fps (10800 \(=\frac{1}{2}\) 21600). Table starts at "VRIFFR +26". See below.
\(K_{\text {ewdl }}\) : Constant, program notation "LEWDI", scale factor BO, value 0.15.
\(K_{\text {gmmn }}\) : Single precision constant, program notation "FIVE", scale factor gmmn \({ }^{\circ}-1\), units revolutions per 0.1 second. Value is \(5 \times 2^{-14}\), corresponding to a rate of about 0.5493 degrees/second.
\(\mathrm{K}_{\mathrm{gmxd} 2}\) : Constant, program notation "GMAX/2", scale factor BO, G-units. Value is 0.16 , corresponding to \(\frac{1}{2} \times 8 \times(1 / 25)\), where first term gives equation factor of \(\frac{1}{2}\), second is GMAX (in g's), and third converts to G-units (of 25 g 's).
\(K_{\text {hav }}\) : Constant, program notation "HALVE", scale factor Bl, units V-units. Value is 0.5 , corresponding to 25766.1973 fps (one V-unit), i.e. "VSAT".
\(K_{k l d}\) : Constant, program notation "KlD", scale factor B8, value 0.0314453125 . Value corresponds to \(0.01 \times 805 \times 2^{-8}\), where first term is "basic" value (corresponding to "Cl6"), second converts to \(\mathrm{fps}^{2}\), and third is scale factor.
\(\mathrm{K}_{\text {k2d }}\) : Constant, program notation "K2D", scale factor B7, value -0.402596836 . Value corresponds to (-1) \(\times 0.002 \times\) \(25766.1973 \times 2^{-7}\), where first term is equation factor, second is "basic" value ("Cl7"), third converts from V-units to fps, and fourth is scale factor.
\(K_{k a 2}\) : Constant, program notation "KA2", scale factor BO, G-units. Value is 0.008 , corresponding to \(0.2 \times(1 / 25)\), where the first term is "basic" value (in g's) and second converts to G-units of 25 g 's.
\(\mathrm{K}_{\text {ka3 }}\) : Constant, program notation "KA3", scale factor B-2, G-units. Value is 0.44720497 , corresponding to \(90 \times(1 / 805) \times 2^{2}\), where first term is "basic" value (in \(\mathrm{fps}^{2}\) ), second converts to G-units, and third is scale factor.
\(\mathrm{K}_{\text {ka4 }}\) : Constant, program notation "KA4", scale factor BO, G-units. Value is 0.049689441 , corresponding to \(40 \mathrm{x}(1 / 805)\), where first term is "basic" value (in fps \({ }^{2}\) ), and second converts to G-units.
\(K_{\text {kacs }}\) : Constant, program notation "KACOS", scale factor B5, value kacs 0.004973592 , corresponding to \((1 / 2 \pi) \times 2^{-5}\).
\(K_{\text {kalim }}\) : Constant, program notation "KALIM", scale factor BO, G-units. Value is 0.06 , corresponding to \(1.5 \mathrm{x}(1 / 25)\), where the first term is "basic" value (in g's) and second converts to G-units of 25 g 's.
\(K_{\text {kasc }}\) : Constant, program notation "KASCALE", scale factor B-13, value 0.97657358 . Value corresponds to \(0.0585 \times(1 / 0.3048) \times(1 / 805) \times\)
\(\frac{1}{2} \times 213\), where first term is accelerometer scale factor (meters/ second per count), second converts to feet, third converts to G-units, fourth compensates for the two-second accelerometer sampling cycle, and fifth is scale factor.
\(K_{k c 3}\) : Constant, program notation "KC3", scale factor B-2, value -0.0247622232 . Value corresponds to ( -1 ) x (1/21 202 900) x \((1 / 2 \pi) \times(25766.1973)^{2} \times(1 / 805) \times 2^{2}\), where first term is "equation" value, second is reciprocal of RE in feet ("entry radius"), third converts to revolutions, fourth converts V-units to fps, fifth converts to G-units, and sixth is scale factor.
\(K_{k t I}\) : Constant, program notation "KTl", scale factor B29, value 15.7788327 \(\times 2^{-1+}\). Value corresponds to (21 202 900) x (1/25766.1973) \(\times 100 \times 2 \pi \times 2^{-29}\), where first term is RE ("entry radius"), second converts V-units, third converts to centi-seconds, fourth converts THETAH to radians, and fifth is scale factor.
\(K_{k t e t a}\) : Constant, progfam notation "KTETA", scale factor B28, value \(38.3495203 \times 2^{-94}\). Value corresponds to \(10^{3} \times 100 \times 2 \pi \times 2^{-28}\), where first term is "basic" value, second converts to centi-seconds, third converts THETAH to radians, and fourth is scale factor.
\(K_{k v s c}\) : Constant, program notation "KVSCAIE", scale factor B-6, value 0.81491944 . Value corresponds to (1/25766.1973) x \(100 \times(1 / 0.3048)\) \(\times 2^{6}\), where first term is one \(V\)-unit (in fps) conversion, second converts from centi-seconds to seconds, third converts from meters to feet, and fourth is scale factor.
\(K_{\text {kwe }}\) : Constant, program notation "KWE", scale factor BO, value \(0.120056652 \times 2^{-1}\). Value corresponds to 1546.70168 x (1/25766.1973), where first term is value in fps (corresponds to radius of 21210605 feet for a period of 86164.10 seconds) and second converts to V-units.
\(K_{\text {maxrng }}\) : Constant, program notation "MAXRNG", scale factor BO, units
 about 0.46247666 revolutions. Value selected so that noun display of DNRNGERR for this information will be +9999.9 nmi (DSKY noun conversion factor is \(2 \pi \times 6,373,338\) meters \(=21622.4965 \mathrm{nmi} / \mathrm{rev}\) ).
\(K_{\text {mldkb2 }}\) : Constant, program notation "-1/KB2", scale factor B-3, value \(-0.0077621078 \mathrm{x}_{3} 2^{4}\). Value corresponds to ( -1 ) \(\times(1 / 0.0025) \times\) (1/25766.1973) \(\times 2^{3}\), where first term is equation factor, second is reciprocal of basic constant ("KB2"), third converts V-units, and fourth is scale factor.
\(K_{\text {mhsca }}\) : Constant, program notation "-HSCALED", scale factor Bl, value \(-0,55305018\). Value corresponds to ( -1 ) x \(28500 \times(1 / 25766.1973\) ) \(x 2^{-1}\), where first term is equation factor, second is value of HS, third converts \(V\)-units, and fourth is scale factor.
\(K_{\text {mksc }}\) : Constant, program notation "-KSCALE", scale factor Bl, value -0.0312424837. Value corresponds to ( -2 ) x \(805 \times(1 / 25766.1973\) ) \(\times 2^{-1}\), where \({ }^{\text {first }}\) term is "equation" value, second converts \(G-\) units to \(\mathrm{fps}^{2}\), third converts V-units to fps, and fourth is scale factor.
\(K_{\text {mkvsc }}\) : Constant, program notation "-KVSCAIE", scale factor B-6, value -0.81491944 , or \(-K_{k v s c}\).
\(K_{\text {mnd }}\) : Constant, program notation "IBITDP", scale factor BO, G-units. Value is \(2^{-28}\), corresponding to about \(10^{-7} \mathrm{~g}\).
\(K_{n q}\) : Constant program notation "NEARI/4", scale factor B2, value \(\left(\frac{1}{4}-2^{-14}\right)\). Value corresponds to \(\left(1^{-12}\right)\), or about 0.99976 , i.e. \(\cos 1 \frac{10}{4}\).
\(K_{\mathrm{pt05g}}\) : Constant, program notation ".05G", scale factor B0, G-units. Value is 0.002 , corresponding to \(0.05 \times(1 / 25)\), where first term is "basic" value (in g's), and second converts to G-units (of 25 g s ).
\(K_{\text {ptb4 }}\) : Constant, program notation "PTI/16", scale factor B4, value \(0.1 \times 2^{-4}\), corresponding to a "basic" value of 0.1.
\(K_{\text {ptone }}\) Constant, program notation "POINT1", scale factor BO, value O.l.
\(K_{\text {Q3 }}\) : Constant, program notation "Q3", scale factor B-1, value 0.167003132 . Value corresponds to \(0.07 \times 25766.1973 \times(1 / 21600)\) \(x 2^{1}\), where first term is "basic" value (in units of nmi/fps), second converts \(V\)-units, third converts to revolutions, and fourth is scale factor.
\(K_{95}\) : Constant, program notation "Q5", scale factor BO, value 0.326388889 . Value corresponds to \(7050 \mathrm{x}(1 / 21600)\), where first term is "basic" value (in units of nmi/rad, corresponding to \(0.3 \times 23500\) ) and second converts from nmi to revolutions.
\(\mathrm{K}_{\mathrm{q} 6}\) : Constant, program notation "Q6", scale factor BO, units radians. Value is 0.0349 , or about \(2^{\circ}\).
\(K_{q 7 f}\) : Constant, program notation "Q7F", scale factor BO, G-units. Value is 0.0074534161 , corresponding to \(6 \mathrm{x}(1 / 805)\), where first term is "basic" value (in fps \({ }^{2}\) ), and second converts to G-units.
\(K_{q 7 f k d m}\) : Constant, program notation "Q7FKDMIN", scale factor BO, Gunits. Value is 0.0080745342 , corresponding to 6.5 x (1/805), where first term is "basic" value (in \(\mathrm{fps}^{2}\) ), and second converts to G-units.
\(K_{q 7 m i n}\) : Constant, program notation "Q7MIN", scale factor BO, G-units. Constant is ( \(1-2^{-28}\) ), corresponding to about 25 g 's (to disable the check in "UPCONTRL" to recompute FACTOR), or \(805 \mathrm{fps}^{2}\).
\(\mathrm{K}_{\mathrm{ql9}}\) : Constant, program notation "Q19", scale factor BO, value 0.5 .
\(K_{q 21}\) : Constant, program notation "Q21", scale factor BO, units revolutions. Value is 0.162037037 , corresponding to 3500 x (1/21600), where first term is "basic" value (nmi), and second converts to revolutions.
\(\mathrm{K}_{\mathrm{q} 22}\) : Constant, program notation "Q22", scale factor BO, units revolutions. Value is -0.092222222 , corresponding to -1992 x (1/21600), where first term is "basic" value (nmi), and second converts to revolutions.
\(K_{r d t r}\) : Single precision set of constants, scale factor B-2, V-units. Multiply table entries by ( \(\frac{1}{4} \times 25766.1973\) ) to convert to fps. Table starts at "VREFER +39". See below.
\(K_{\text {rtgo }}\) : Single precision set of constants, scale factor B-3, units of revolutions. Multiply table entries by 2700 (i.e. \(2^{-3} \times 21600\) ) to convert to nmi. Table starts at "VREFER +52". See below.
\(K_{\text {spvq }}\) : Single precision constant, program notation "SPVQUIT", scale factor Bl, V-units. Octal value is 00476g, corresponding to about 1000.2 fps.
\(K_{t c d u}\) : Single precision constant, program notation "TCDU", scale factor \(B-1\), value O.l. Value corresponds to \(\frac{1}{2} \times 0.1 \times 2^{1}\), where first term reduces angle rate from units of computing cycles ( 2 seconds) to seconds, second is "basic" value (to determine angle increment per 0.1 second), and third is scale factor.
\(K_{\text {vfin }}\) : Constant, program notation "VFINAL", scale factor Bl, V-units. Value is 0.51618016, corresponding to 26600 x (1/25766.1973) \(\times 2^{-1}\), where first term is "basic" value (in fps), second converts to V-units, and third is scale factor.
\(K_{v f n l}\) : Constant, program notation "VFINALI", scale factor Bl, V-units. Value is \(0.5239422^{7} 3\), corresponding to 27000 x (1/25766.1973) \(\times 2^{-1}\), where first term is "basic" value (in fps), second converts to \(V\)-units, and third is scale factor.
\(K_{\text {Vmin }}\) : Constant, program notation "VMIN", scale factor Bl, V-units. Value is 0.25 , corresponding to a velocity of \(\frac{1}{2}\) (25766.1973) fps, or about 12883.1 fps.
\(K_{\text {vmn }}\) : Constant, program notation "VIMIN", scale factor Bl, V-units. Value is 0.34929485 , corresponding to 18000 x ( \(1 / 25766.1973\) ) \(\times 2^{-1}\), where first term is "basic" value (in fps), second converts to \(V\)-units, and third is scale factor.
\(K_{\text {vquit }}:\) Constant, program notation "VQUIT", scale factor Bl, V-units. Value is 0.019405269 , corresponding to \(1000 \times(1 / 25766.1973\) ) \(\times 2^{-1}\), where first term is "basic" value (in fps), second converts to V-units, and third is scale factor.
\(K_{\text {vrcont }}\) : Constant, program notation "VRCONT", scale factor Bl, V-units. Value is 0.0135836886 , corresponding to 700 x (1/25766.1973) \(\times 2^{-1}\), where first term is "basic" value (in fps), second converts to V-units, and third is scale factor.
\(K_{\text {vrfr }}\) : Single precision set of constants, scale factor Bl, V-units. Multiply table entries by ( \(2 \times 25766.1973\) ) to convert to fps. Table starts at "VREFER". See below.

K2ROLL: Quantity, scale factor BO (only the sign is used, with quantity initialized to a non-zero magnitude in "STARTENT"), used to determine sign of ROLLC (used for lateral control).

KAT: Quantity, scale factor BO, G-units, computed in "INITROLL" the first cycle that \(D\) is not less than \(K_{p t 05 g}\), and used as the "drag to lift up if down".

KLAT: Value of lateral switch gain computed in "STARTENT", scale factor BO.

LAD: Value of "maximum L/D (minimum actual vehicle L/D)" initialized in "STARTENT" from \(C_{\text {adpad, }}\) scale factor BO.

LAT: See Coordinate Transformations.
LATANG: Value of "lateral range", scale factor B2, units radians. Program notation also "XRNGERR".
LATSPL: See Display Computations.
LdD: Value of "desired lift-to-drag ratio (vertical plane)", scale factor BO. Program notation "L/D".

IdDI: Value of LdD used to compute ROLIC ( set to IdD at start of "LIMITL/D", and perhaps subsequently changed), scale factor BO.

IdDCALC: Value of L/D computed in "TARGETNG" (for telemetry purposes only), scale factor BO. Uses same cell as TTE (see Display Computations). Program notation "L/DCALC".

IdDCMINR: Value of LAD cos \(15.2^{\circ}\) computed in "STARTENT", scale factor BO. Program notation "L/DCMINR".

LEQ: Value of (VSQUARE - 1), scale factor B2, units of gravity (divide by 25 to convert to G-units).

LEWD: Value of "UPCONTRL" reference L/D, scale factor BO. Updated in "RANGER" and initialized in "INITROLI".

\section*{LNGSPL: See Display Computations.}

LOD: Value of "Final Phase L/D" loaded in "STARTENT", scale factor BO, from Codpad \({ }^{\circ}\)
LONG: See Coordinate Transformations.
mVREL: Complement of relative velocity, program notation "-VREL", scale factor Bl, V-units. Computed in "CM/POSE".

NV: Magnitude of VEL (velocity normalized by satellite velocity of 25766. 1973 fps ), scale factor Bl, V-units. Program notation "V". One V-unit, i.e. 25766.1973 fps, corresponds to \(\sqrt{\mu / R E}\), where \(R E=21202900\) (300 000' above 2.09029E' (feet).

OLDUYA: Previous value of UYA saved in "CM/POSE", scale factor Bl.
POSEXIT: Single precision exit address from "CM/POSE". Set to "P62.3" at start of "P62"; set to "STARTENT" in "P63"; and set to "SCALEPOP" (the normal beginning of the entry computations) in "STARTENT".

PREDANG: Single precision value of "predicted range" computed in "PREDICT3", scale factor B-3, units revolutions (one revolution is 21600 nmi ). Terms are double precision if possible.

Q2: Value of final-phase ranging information used in "RANGER" to compute ASPl, scale factor BO, units revolutions. It is initialized in "STARTENT" based on the specified value for LAD.
Q7: Value of minimum drag for "UPCONTRL", scale factor BO, G-units. Initialized in "STARTENT".
\(\underline{R}_{t}, \underline{R}_{t i}\) : See Coordinate Transformations.
RDOT: Value of altitude rate, scale factor Bl, V-units.
RDOTREF: Value of reference RDOT computed in "UPCONTRL", scale factor Bl, V-units.

RDRFV: Value of \(K_{\text {rdtr }}\) table for present \(N V\), same scaling as \(K_{r d t r}\).
ROLLC: Value of roll command output of equations, scale factor BO, units revolutions.

ROLId 180: Single precision angle, program notation "ROLL/l80", giving the first Euler angle of the CM attitude (about UBX in "roll"), scale factor B-l, units revolutions.

ROLIdPIP: See General Program Control.
ROLLHOLD: See Digital Autopilot Entry Routines.
RTGON67: Value of THETAH (with negative sign if not yet past target) loaded in "TARGETNG" for use with nouns 64 and 67 , scale factor BO, units revolutions. Program notation also "RTGON64".

RTOGOV: Value of \(K_{r t g o}\) table for present \(N V\), same scaling as \(K_{r t g o}\).
SINTH: See Coordinate Transformations.
THETA: See Coordinate Transformations.
THETAH: Value of "desired range" (angle between present position vector and appropriately rotated target vector), scale factor BO, units revolutions.

TIMEdRTO: Value of computer time for which \(\underline{R}_{t}\) is valid, scale factor B28, units centi-seconds. Loaded in "STARTENI", with program notation "TIME/RTO".
UBX, UBY, UBZ: Unit vectors, scale factor Bl, computed in "CM/POSE". They define the "body axis triad" in reference coordinates: if all three gimbal angles are zero, UBX = unitX [REFSMMAT] etc; otherwise, the sequence is about \(y, z, x\) axes (inner, middle, and outer respectively) to go from platform to body axes.

UNI: Unit vector, scale factor Bl, giving the "normal to the trajectory plane".

UNITV: Unit VEI vector, scale factor Bl.
UXA, UYA, UZA: Unit vectors, scale factor BI, computed in "CM/POSE". They define the "trajectory triad" in reference coordinates. UXA is in the direction of mVREL; UYA is in the direction of \(\underline{V} \underline{r}\) (left constant if magnitude of \(\overline{m V R E L}\) is less than \(K_{s p v q}\) ), and UZA completes the right-handed coordinate system (in direction of UYA \(* \underline{v}\) ). Note that UXA corresponds to "- UVA" and UZA corresponds to "UNA".

Vl: Value of initial velocity for "UPCONTRL", scale factor B1, V-units.

VBARS: Value of \(\mathrm{VL}^{2}\), scale factor B 2 ( since \(V L\) in units of VSAT, no explicit division by VSAT is necessary to obtain VBARS).
VEL: Value of velocity used in entry computations (inertial or relative), scale factor Bl, V-units.

VL: Value of exit velocity for "UPCONTRL", scale factor Bl, V-units.
VMAGI: Magnitude of \(V\) computed at the end of "CM/POSE", scale factor B7, units meters/centi-second, computed for display purposes.

VREF: Value of reference velocity for "UPCONTRL", scale factor BI, V-units.
VSI: Value of the lesser of \(V 1\) or \(K_{\text {hav }}\) (V-unit factor), scale factor Bl, V-units.

VSQUARE: Square of NV, scale factor B2(cf. discussion on VBARS).

Proceed to address specified by 60GENRET

\section*{Quantities in Computations}

See also list of major variables and list of routines

6OGENRET: Single precision cell used to retain return address information from "S61.1".

ALFACOM: See Digital Autopilot Entry Routines.
AVEGEXIT: See General Program Control.
BETACOM: See Digital Autopilot Entry Routines.
BETAd180: See Entry Computations.
Calfapad: Single precision erasable memory constant, program notation alfapad "ALFAPAD", scale factor B-1, units revolutions, giving the nominal trim angle (expected to be a negative number).

CMDAPMOD: See Digital Autopilot Entry Routines.
CMdGYMDT: See Digital Autopilot Entry Routines.
DNLSTCOD: See Telemetry.
ENTRYVN: See Entry Computations.
EXTVBACT: See Verb Definitions.
HEADSUP: Single precision quantity used to indicate desired initial attitude of vehicle: it is positive non-zero if a ROLLC of 180 degrees (lift down) is desired, which is a "heads up" attitude. Should be set to -l (or O) if a ROLLC of O degrees (heads down/ lift up) is desired. Scale factor is B14, and it is initialized at start of "P61" to -1 (before the N61 display which can be used to change it there).
\(K_{\text {bt14 }}\) : Single precision constant, program notation "BITI4", scale factor BO, units revolutions. Value is 0.5 , corresponding to 180 degrees. Used in "P61" as double precision information, with least significant half zero, for initializing ROLLC; in "P62.1", however, is single precision, with least significant half of ROLLC left alone.
\(K_{\text {cs30im }}\) : Constant, program notation "C(30)LIM", scale factor Bl , value 0.566985 . Used in program in such a way (a check on performing overflow) that effective value is 0.86603 , or cosine 30 degrees: the value in memory is \(1.0-\frac{1}{2} \cos 30^{\circ}\).
\(K_{\text {rvsc }}\) : Dummy constant used to indicate rescaling of HEADSUP information from a scale factor of B14 to a scale factor of BO revolutions, "value" \(2^{-14}\) (see HEADSUP). If HEADSUP were loaded in N61 with a value of -04097, for example, then ROLLC would be set to \(+90^{\circ}\).
MM: Storage for state vector time in "NEWRNVN", to ensure a consistent state vector for "S61.2", scale factor B28, units centi-seconds. It is the time tag for \(R\) and \(V\), and hence is used in "S61.2" to compute TTE2 (see Displyay Computations).
P63FLAG: See Digital Autopilot Entry Routines.
POSEXIT: See Entry Computations.
\(\underline{R}_{\text {one }}:\) See Display Computations.
ROLLC: See Entry Computations.
SWdNDX: See Digital Autopilot Entry Routines.
UNI: See Entry Computations (computed in "NEWRNVN" for "S61.2").
URONE: See Display Computations.
UXA, UYA, UZA: See Entry Computations.
\(\underline{V}_{\text {one }}\) : See Display Computations.

See also list of major variables and list of routines

IdPIPADT: See IMU Computations.
AIG: See Digital Autopilot Entry Routines.
AIGdPIP: Value of AIG sampled in "READACCS", i.e. the value of CDU sampled about 0.05 seconds before accelerometers read, scale \({ }^{\mathrm{y}}\) factor B-l, units revolutions, single precision. Program notation is "AIG/PIP".

ALFAd180: See Entry Computations (quantity is updated in "ATTRATES").
ALFAdPIP: Value of ALFAdl80 sampled in "READACCS", scale factor B-1, units revolutions, single precision. It is computed based upon the same angle sample as for AIGdPIP. Program notation "ALFA/PIP".

ALMCADR, ALMCADR+l: Pair of erasable memory cells used to store the information on the calling address to the "ALARM" type routines (including "BAILOUT" and "POODOO"). Information is in 2CADR format (see 3420.5-27), with ALMCADR giving S-register information and ALMCADR+l giving BBCON (i.e. BBANK and SUPERBNK) information. Cells can be displayed by NO8 to permit identification of the specific area of the program responsible for the generation of the fault condition.

AMG: See Digital Autopilot Entry Routines.
AMGdPIP: Value of AMG sampled in "READACCS", i.e. the value of \(\mathrm{CDU}_{\mathrm{z}}\) sampled about 0.05 seconds before accelerometers read, scale factor \(B-1\), units revolutions, single precision.

AOG: See Digital Autopilot Entry Routines.
AOGdPIP: Value of AOG sampled in "READACCS", i.e. the value of CDU \(_{\mathrm{x}}\) sampled about 0.05 seconds before accelerometers read, scale factor \(B-1\), units revolutions, single precision.

AVEGEXIT: Cell containing in 2CADR format the starting address of the computations to be performed after "AVERAGEG" is done (program notation also AVGEXIT). It is set to "AVGEND" by "READACCS"; to "CALCN83" by "TIGON"; to "CALCN85" by "P4ORCS" and "P4OSXTY"; to "CM/POSE" by "P62"; to "SERVEXIT" by "P67.1", "POST4I", "S6l.IC", and "TIGNOW"; to "SIVBCOMP" by "P15JOB"; to "S40.8" by "P4OSXTY"; and to "VHHDOT" by "P1l".

BASETEMP: Cell used in "V37XEQ" to store temporarily the appropriate value of \(K_{\text {fcadm }}\) for use in generating starting address information for the job 毛cadm initiated by V37 processing.

BBANK: A computer hardware cell (address \(0006_{8}\) ) containing in bits 15-11 the fixed memory bank (FBANK) currently being used and in bits 3-1 the erasable memory bank number. Bits 7-5 of the constants in the proper format for BBANK loading can contain SUPERBNK information, and constants in this format are referred to as "BBCON" format (see 3420.5-27). The fact that the program retains BBANK information is used in "DELAYJOB" to retain the indexing data for the DELAYIOC cell employed (since in that routine the erasable memory bank is not significant and the fixed memory bank number is 00).

BETAdl80: See Entry Computations (quantity is updated in "ATTRATES").
BETAdPIP: Value of BETAdl80 sampled in "READACCS", scale factor B-l, units revolutions, single precision. Cf. ALFAdPIP.
\(\underline{C}_{\text {unitw }}\) : Erasable memory vector constant, scale factor BO, program notation "UNITW". It gives the polar axis in the reference coordinate system. The x component (also called "-AYO" in the program) gives the "true to mean pole rotation about the \(-Y\) axis;" the \(y\) component (also called "AXO" in the program) gives the "true to mean pole rotation about the +X axis."

CADRFISH+2: See Display Interface Routines.
CADRSTOR: See Data Input/Output.
CLPASS: See Data Input/Output.
CMdGYMDT: See Digital Autopilot Entry Routines.
DELAYLOC+i ( \(\mathrm{i}=0-3\) ): Set of four single precision cells used to contain the starting address identifications for jobs put to sleep using "DELAYJOB", in FCADR format. If an attempt is made to put more than 4 jobs to sleep using the routine, a software restart (pattern 311048 ) is produced.

DELVREF: Value of accelerometer output (scaled and compensated) converted to reference coordinates, scale factor B7, units meters/centisecond.

DNLSTCOD: See Telemetry.
DNTMGOTO: See Telemetry.
DSPCNT: Single precision counter used to cycle through the DSPTAB ( \(\mathrm{i}=10-0\) ) to be changed in "DSPOUTSB", scale factor B14. The DSPTAB \(_{i}\) word loaded at one entrance to "DSPOUTSB" is the first one checked at the next entrance, but that word will not be checked again until all the other words have been examined and, if necessary, loaded into OUTO.

DSPCOUNT: See Data Input/Output.

DSPFIG+2: See Display Interface Routines.
DSPLIST, DSPLOCK: See Data Input/Output.
DSRUPTSW: Single precision cell that is used for control of the computations that are performed when "TLRUPT" is entered. If it is not negative non-zero when "TLRUPT" is entered, it contains a number between 3 and 0 , scale factor B14, used to control the branching at the end of "PROCEEDE" so as to complete a cycle ( 3 through 0 and back to 3 again) in 0.48 seconds. If the cell is negative non-zero, bits 2-1 contain the same "T4RUPT" branching control ("PROCEEDE" is entered and these bits employed every 0.12 seconds), while bits 12-9 contain, scale factor B6, the complement of the number of \(20-\) millisecond intervals still be to loaded into TIME4 to achieve synchronism with the basic T4RUPT period of 0.12 seconds. Bit 14 is used to achieve an alternate selection of clearing OUTO or loading new information into OUTO. If OUIO was loaded with a non-zero value when the basic 0.12 -second T4RUPT cycle was performed, then DSRUPTSW is set (in "HANG2O") to DSRUPTSW - 22400 , where the first " 2 " causes bit 14 to be set 0 (note that computation same as adding \(55377_{8}\) ), and the " 24 " is 5 with scale factor B6, signifying that five more \(20-\mathrm{ms}\) loadings of TIME4, plus the current one, are needed to satisfy the 0.12 second synchronism. If "HANG2O" is entered, TIME4 is set to generate another interrupt in 0.02 second. When it is received, bit 14 of DSRUPTSW will be O, so OUTO will be cleared, bit 14 set to 1 , and TIME4 reset to 20 ms . In addition, DSRUPTSW is incremented by \(\mathrm{K}_{1 \mathrm{~b} 6}\) (making the upper bits equivalent to -4 B 6 , since bit \(14=1\), for a negative DSRUPTSW, represents a magnitude of 0 ). The next time the interrupt is generated, bit 14 will be one in "TLRUPT", so a new OUTO can be generated if required (if not, the number of remaining \(20-\mathrm{ms}\) intervals is determined and TIME4 and DSRUPrSSW loaded immediately). In order to load all 11 (DSPTAB+O DSPTAB+10) DSKY display registers, a total time of \(11 \times 0.04=\) 0.44 seconds is required (measured from the first loading of the first register to the end of the 20 ms wait after reset of OUTO for the last register). As part of a verb 36 fresh start, DSRUPTSW \(=-K_{12 b 5}\), to force clearing of all DSPTAB-driven relays (bit \(14=1\) due to this setting, of course) before starting the normal T4RUPT O.12-second cycle.
DVTOTAL: Sum of magnitudes of scaled and compensated DELV each twosecond entrance to "SERVICER", scale factor B7, units meters/ centi-second. Quantity is initialized to 0 in "PREREADI", and can be displayed in R3 of N4O (XXXX.X fps) or N8O (XXXXX. fps). It is the "line integral" of accumulated velocity, not the magnitude of the velocity vector increment: the magnitude is taken each two-second Average-G cycle of DELV and this scalar is added to DVTOTAL.

EBANK: See Data Input/Output.
ERCOUNT: See Testing Routines.
ERESTORE: See Testing Routines.
EXTVBACT: See Verb Definitions.

FAILREG+i ( \(i=0-2\) ): Set of three single precision cells used to retain alarm pattern code information. They are all reset to zero by a verb 36 fresh start (or V25N9E E E E), and they can be displayed by the use of noun 09. Use of the error reset DSKY key causes FAIIREG+O and FAILREG+1 to be reset zero (FAILREG+2 is left alone). FAIIREG+O contains the first alarm pattern received after the reset; FAILREG+l contains the second; and FAIIREG+2 always has the most recent (and hence would be the same as FAIIREG+0 if one alarm has occurred, or FAILREG+l if only two alarms have occurred). If FAILREG \(+0=0\), then no alarms have occurred since the last error reset, and the alarm to occur most recently is in FAILREG+2.

GDI: Value of gravity times computing interval, scale factor B8, units meters/centi-second. Program notation is "GDT/2", in recognition of the fact that it is "1 \(\frac{1}{2}\) GDT" for a standard velocity scaling of B7 meters/centi-second. When "CALCRVG" is first entered, the quantity in \(G D \underline{T}\) is the value computed the previous computation cycle.

GDT1: Value of gravity times computing interval computed in "CALCGRAV", same scaling and units as GDT (program notation "GDT1/2").
GOBL: Value of "normalized" oblateness component of gravity computed for earth-centered computations only. Must be multiplied by \(-\mu / r^{2}\) to convert to units of acceleration. It is used in "S40.9" to correct output of Lambert routine (for earth-centered computations). Program notation "GOBL/2". Loaded with GOBLI whether earth-centered or moon-centered, but not used in "S40.9" for moon-centered. Scale factor Bl, dimensionless.

GOBLI: Value of GOBL computed in "CALCGRAV", same scaling as GOBL (program notation "GOBLI/2").

IMODES30, IMODES33: See IMU Computations.
IMUCADR: See IMU Computations.
INLINK: See Data Input/Output.
\(\mathrm{K}_{\text {lb6 }}\) : Single precision constant, program notation "BIT9", scale factor B6, value \(00400_{8}\), corresponding to \(1 \times 2^{-6}\), used to increment DSRUPTSW for \(20-\mathrm{ms}\) OUTO update rate (cf. DSRUPTSW).
\(K_{2 j}\) : Constant, program notation "2J", scale factor B-l, value 3.2469201E-3 x \(2^{1}\). Value corresponds to \(2 \times 1.62346005 \mathrm{E}-3 \mathrm{x}\) 21, where first term is an equation factor of 2 , second is the nominal value of the computer-employed first gravitational harmonic coefficient (note that the "standard" value, such as that employed in \(\mathrm{K}_{\mathrm{j} 2}\) of Orbital Integration, is \(1.6234 \mathrm{E}_{\mathrm{E}-3 \text { ), }}\), and third is scale factor. Octal value corresponds to a harmonic coefficient value of about \(1.6234554 \mathrm{E}-3\).
\(\mathrm{K}_{2 \mathrm{~s} 22}\) : Constant, program notation \(" 2 \operatorname{SEC}(22)\) ", scale factor B22, units centi-seconds. Value is \(200 \times 2^{-22}\), corresponding to a value of 2 seconds.
\(\mathrm{K}_{12 \mathrm{~b} 5}\) : Single precision constant, program notation "PRIO12", scale factor B6, value 12000 , corresponding to \(24 \times 2^{-6}\). It is used to initialize DSROPTSW to ensure clearing of all DSPTAB registers for a V36 fresh start (see DSRUPTSW): it forces 12 sets of OUTO settings (DSPTAB+ll and then remaining DSPTAB's) and subsequent OUTO \(=0\) settings before starting the normal T4RUPT 0.12-second cycle, hence the notation.
\(\mathrm{K}_{20 \mathrm{j}}\) : Constant, program notation "20J", scale factor B-l, value 3.2469201E-2 \(\times 2^{1}\). Value corresponds to \(20 \times 1.62346005 \mathrm{E}-3 \mathrm{x}\) \(2^{1}\), where first term is an equation factor of 20 (to give a net effect of "I - 5 SIN \(\boldsymbol{\beta}^{2}\) " for the factor it multiplies), second is the nominal value of the computer-employed first gravitational harmonic coefficient (cf. \(\mathrm{K}_{2 j}\) ), and third is scale factor. Octal value corresponds to a harmonic coefficient value of about \(1.62346009 \mathrm{E}-3\).
\(\mathrm{K}_{\text {fcadm. }}\) : Table of fixed-memory starting addresses used in "V37XEQ" to i set BASETEMP, arranged in FCADR format (bits 15-1l give the fixed-memory bank and bits \(10-1\), when added to \(2000_{8}\), give S-register contents). Program notation for first cell in table ( \(i=0\) ) is "FCADRMM".
\(K_{\text {mudt }}\) : Constant, prggram notation "-MUDT(E)", scale factor B44, mmudt \(_{0}\) units meters \({ }^{\text {/ }}\) centi-second. Value is \(-7.9720645 \mathrm{El2} \times 2^{-44}\), corresponding to \(-1 \times 3.98603225 \mathrm{ElO} \times 200 \times 2^{-44}\), where first term is an equation factor to give proper sign of result, second is value of \(\mu\) (for time in centi-seconds) for the earth, third is computing interval of two seconds expressed in centi-seconds, and fourth is scale factor.
\(K_{\text {mmudt }}\) : Constant, program notation "-MUDT(M)", scale factor B44, \(\mathrm{m}_{\text {mudt }}^{2}\) units meters \(/\) centi-second. Value is \(-9.805556 \mathrm{ElO} \times 2^{-4}\), corresponding to \(-1 \times 4.902778 \mathrm{E} 8 \times 200 \times 2^{-44}\), where first term is an equation factor to give proper sign of result, second is value of \(\mu\) (for time in centi-seconds) for the moon, third is computing interval of two seconds expressed in centi-seconds, and fourth is scale factor.
\(K_{\text {mxdlv }}\) : Single precision constant, program notation "-MAXDELV", scale factor B14, units accelerometer counts. Stored value is -6398 x 214; used in program in such a way that an effective value of 6399 is employed, giving an alarm (at the start of "SERVICER") if an accelerometer output of 6400 pulses for 2 seconds (i.e. 3200 pps ) is received.
\(K_{\text {nov37m }}\) : Single precision constant, program notation "NOV37MM", scale factor B14, giving the number of table entries minus 1 in
\(\mathrm{K}_{\mathrm{prml}}\) (and associated V37 tables) for new programs that can be startèd by the V37 logic (including the minimum key rendezvous driver programs, but excluding POO). Value is \(00046_{8}\), corresponding to decimal 38 (meaning 39 programs).
\(K_{p p l}\) : Constant, program notation "KPIPl", scale factor B-7, units meters/centi-second per accelerometer cqunt. Value is 0.07488, corresponding to \(5.85 \times 10^{-2} \times 10^{-2} \times 2^{7}\), where first term is nominal accelerometer scale factor in units of centimeters/second per count, second converts to meters, third converts to centiseconds, and fourth is scale factor.
\(\mathrm{K}_{\mathrm{prml}}^{\mathrm{i}}\) : Table of program information used in association with V37 program i changes. Table is arranged in order of decreasing program numbers (a higher i is a lower number), with first cell having program notation "PREMMI". Bits 7-1 of the cell give the program number (since program numbers are in decimal, seven bits are necessary to represent numbers above 63); bits 10-8 are the erasable memory bank number (required when the job is established); and bits 15-13 are the job's required DNLSTCOD setting for telemetry. See information below.
\(K_{\text {resq }}\) : Constant, program notation "RESQ", scale factor B59, units \(\mathrm{m}_{\text {meters }}{ }^{2}\). Nominal value is \(40.6809913 E 12 \times 2^{-59}\), where the decimal portion corresponds to the square of 6378165.2 meters. Octal value is \(0000 l_{8} 05000_{8}\), however, which corresponds to the square of about 6378238.8 meters.
\(K_{\text {rndbt }}\) : Single precision constant, program notation "BIT5", scale factor (as used) B23, units centi-seconds. Value is 00020 , corresponding to (as used, i.e. added to the least signilicant half of channel 4 time information) 0.5 centiseconds. Used to account for the fact that channel 4 bits 5-1 "read \(20_{8}\) for the first interval after a TIMEl increment", thus causing bit 6 of channel 4 to be incremented 5 ms out of phase with TIMEl increments.
\(K_{r t u}\) ( \(\left.i=0-1 l\right):\) Table of single precision constants, program notation \(r t u_{i}\) "RELTAB", containing in bits 15-12 the required values to be loaded into bits \(15-12\) of OUTO for DSPTAB. Value in these bits is ( \(i+1\) ). Bit 11 is zero. The least significant 5 bits of these same constants are used for \(\mathrm{K}_{\mathrm{rtb}}^{\mathrm{I}}\) (see Data Input/Output).

IGYRO: See IMU Computations.
LREG: Computer "L" register (address \(0001_{8}\) ), used to retain alarm pattern information in alarm-generation package.

MARKINDX: See Optics Computations.

MINDEX: Single precision cell, scale factor B14, used to select the appropriate table entries for a V37-selected program change (loaded based on equality of MMNUMBER and bits \(7-1\) of \(K_{p r m l}\)
with the value of \(i\) ).

MMNUMBER: Single precision cell, scale factor Bl4, used to retain the desired new program number for a V37 program change (it is the number entered in "MMCHANG" or is 0 if "V37" entered from "VERB96"). If the TVC DAP or SPS engine-on are indicated, it is set 0.

MMTEMP: Single precision cell loaded in "V37XEQ" with the value of the appropriate \(K_{\text {prm }}\) for use in generating appropriate information in connection with the job to be established by V37 processing.

MONSAVE, MONSAVE1: See Data Input/Output.
MRKBUF1: See Optics Computations.
NEWJOB: Cell set positive non-zero to indicate that a job of higher priority than the one presently being performed (the "DUMMYJOB" loop has minimum priority) has been established and is awaiting execution. Cell 0067 is used for the word, and must be addressed periodically in order to avoid generating a hardware restart (see hardware documentation for details).

NOUNREG: See Data Input/Output.
NOUT: Single precision cell, scale factor B14, used to provide a count of the number of DSPTAB display outputs (DSPTAB+O - DSPTAB+10) that are remaining to be changed: if it is non-zero but none are to be changed, it is set 0 .

NVWORD+2: See Display Interface Routines.
OPTIND: See Optics Computations.
OPTMODES: See Optics Computations.
OUTO: Computer output channel 10, used to transmit relay driving information to the display system. Bits \(15-12\) specify the group of relays to be driven, while bits ll-l specify their new state.

PHASEi, -PHASEi ( \(i=1-6\) ): Set of cells used to contain program octal "phase" information, used to control program restarts (each "i" is called a "group"). To check the validity of erasable memory information (and the phase information itself), a check is made that the information in PHASEi, when complemented, is the same as the information in -PHASEi (for all i). A setting of to for PHASEi means that the group restart controlled by that cell is "inactive" (see Section VIIC of 3420.5-27 for details of restart logic computations not covered in this writeup). In the interests of avoiding excessive detail (since the "normal" mode of operation of the computer system does not require restarts), most of the settings for restart groups are not shown in the writeups, although settings in some cases form an integral part of the program control logic, and hence are shown in such cases.

As a general guide to allocation of restart groups, the following areas where each group is used are supplied as a partial list:
\#l: P2O (setting to l. 11 causes "PIKUP2O" to be entered). A setting to 1.7 is done in "CHKLINUS" for R61-specified R60 maneuver. A setting to 1.5 is used to protect "S40.9" (set by "SETUP.9"), which of course only occurs with Average-G on, when P2O doesn't run. If "ROO" concludes that P2O should not run, it resets group 1 to inactive, thus over-riding the "AVGEND" setting.
\#2: Orbital integration (including the periodic state vector update started by "STATINTI" for a 2.5 setting). A setting of 2.7 causes "R22" to be established, and 2.13 causes "REDOR22" to be established (the latter setting is done by "AVGEND", and written over by "ROO" if necessary). Group 2 is also used for protection within the R22 computations, which are done at sufficiently high priority that they would not be expected to be interrupted by mission programs except while R22 is performing "WAITONE". Restart priority lower than that at which job runs to permit mission programs to set e.g. TRACKFIG. A 2.11 setting is done by "VERB94" for P23 computations (to permit "V94ENTER" to be established while getting rid of e.g. R52 if it happens to be running in P23 then).
\#3: "S4O.13"; "P1I"; "ENGINOFF".
\#4: All V37-selectable programs except POO (and also other mission program sequences running outside of Average-G cycle, such as "P65.1"); "GCOMPVER"; "AZMTHCGI". Also V37 processing itself.
\#5: "READACCS" (and subsequent "SERVICER" computations); Prelaunch alignment.
\#6: "CLOKTASK"; Entry autopilot; P27; "S40.6" (via "PRE40.6").
PHSPRDT2: Single precision erasable memory cell used to contain priority or time information for erasable memory restarts using group 2 (see Section VIIC of \(3420.5-27\) ). It is set to indicate priority \(05_{\mathrm{g}}\) for POO selection in "ROO" in order to achieve proper priority information for group 2 use in the periodic POO orbital integration.

PHSPRDT4: Single precision erasable memory cell used to contain priority or time information for erasable memory restarts using group 4 (see Section VIIC of 3420.5-27). It is set to the priority of the mission program that is established by "V37XEQ", for subsequent use by erasable memory restarts.

PIPA: See IMU Computations.
PIPCTR: Single precision cell, scale factor B14, used to control the performance of "QUIKREAD". It is set to 2 in "READACCS" to allow "QUIKREAD" to be performed 1.0 and 1.5 seconds after "READACCS" ("READACCS" itself causes "QUIKREAD" to be done 0.5 seconds after "READACCS").

PRIORITY ( \(i=0-6\) ): Set of cells containing in bits \(14-10\) the priority information on computer jobs associated with the job register set (see Section VIIB of 3420.5-27). If the cell contains -0 , this indicates that the corresponding job register set is available.

QREG: Computer hardware address 0002 , loaded with return address information after a "TC" machine language transfer instruction. See 3420.5-27 for details (program notation "Q"): the S-register portion is loaded into QREG.
\(R_{n l}\) : Temporary storage for updated value of \(\underline{R}\) in "CALCRVG", used for restart protection purposes and to ensure a homogeneous state vector on the downlink (same units and scaling as \(\underline{R}\) ). It is used in "NORMLIZE" to initialize \(\frac{R}{}\) for Average-G: in such cases, \(\mathrm{R}_{\mathrm{n} 1}\) loaded either by "Pll" or "MIDTOAV2".

RCSFLAGS: See Digital Autopilot Interface Routines.
REDOCTR: Single precision cell, scale factor B14, used to count the number of hardware restarts (entrances to "GOPROG") that have been performed. It is initialized to 0 as part of a verb 36 fresh start.

REQRET: See Data Input/Output.
RESTREG: See Display Interface Routines.
ROLIdl80: See Entry Computations: quantity updated in "ATTRATES".
ROLIdPIP: Value of ROLLdll 80 sampled in "READACCS", scale factor B-l, units revolutions, single precision. See ALFAdPIP.

RSBBQ: Value of address where hardware restart (causing entrance to "GOPROG") was generated. Most significant half contains BBCON (see BBANK above) information and least significant half has. Q-register information.

RTX2: See Orbital Integration. It is left at 0 for earth and 2 for moon by "MIDTOAV2" (used to initialize \(R\) etc. for Average-G), and is set 0 in "Pll". Used e.g. in "CAICGRAV" to determine proper gravity formula to be used.

SCALSAVE: Value of (Channel 3, Channel 4) saved in "P06", scale factor B23, units centi-seconds. Used to restore the proper value of the computer clock (modulo \(2^{23}\) centi-seconds or about 23.3 hours) after a period of low-power operation.

SELFRET: Cell containing return address information to routine calling "CHECKNJ" (a location in the computer self-check memory bank, hence the name). Must be preset as part of the initial conditions routine so that the "DUMMYJOB" routine will function properly.

SIN \(\varnothing\) : Value of sine of latitude computed in "CALCGRAV", scale factor Bl.

SKEEPi: See Testing Routines.
SMODE: See Testing Routines.
SOLD, SRATE: See Optics Computations.
STARIND: See Inflight Alignment.
SUPERBNK: Value of computer channel 07, containing in bits 7-5 the specification of the "super bank" setting: value of 0-3 causes FBANK settings of \(30-37\) to read out correspondingly numbered fixed memory banks; a setting of 4 causes FBANK settings of \(30_{8}{ }^{-}\) 33. to read out fixed memory banks 40-43 (used e.g. for most DSKY processing). Also referred to as FEXT.
\(T_{p p t m l}\) : See IMU Computations.
T5LOC: See Digital Autopilot Interface Routines.
T5PHASE: See Digital Autopilot RCS Routines.
TEMPMM: See Minimum Key Rendezvous.
TIME2SAV: Value of T \({ }_{\text {now }}\) retained in "P06", scale factor B28, units centi-seconds (the corresponding value of channels 3 and 4 is in SCALSAVE), used to permit restoration of the proper value of the computer clock ( \(T_{\text {now }}\) ) after a period of low-power operation.
TIME3, TIME4, TIME5: Computer hardware erasable memory counter clock cells, whose overflow cause program interrupts \#3, \#4, and \#2 respectively (all are scale factor \(\mathrm{Bl}_{4}\) in units of centi-seconds, and are set to ( 16384 - t), with \(t\) in centi-seconds, to cause overflow in "t" centi-seconds). See 3420.5-27.

TOLD, TRATE: See Optics Computations.
TRKMKCNT: See Measurement Incorporation.
TTE, TTE2: See Display Computations.
UPSVFLAG: See Uplink Processing.
\(V_{\mathrm{nl}}\) : Temporary storage for updated value of V in "CALCRVG", used for restart protection purposes and to ensure a homogeneous state vector on the downlink (same units and scaling as \(\underline{V}\) ). It is used in "NORMLIZE" to initialize \(V\) for Average-G: in such cases, \(\mathrm{V}_{\mathrm{n} 1}\) is loaded either by "PII" or "MIDTOAV2".

VACIUSE ( \(I=1-5\) ) : Control cell indicating, if zero, that the associated VAC area is assigned; otherwise, it contains its own address (hence VAC3USE +1 would be the address of the first available cell in the 43-cell VAC area). Quantities indicated as in "push-down list", or by their "relative address" identification, are stored in a VAC area. See 3420.5-27 for more details.

VERBREG: See Data Input/Output.

VHFCNT: See Measurement Incorporation.
WTOPTION: See Optics Computations.
XOLDBUF: Value of previous XPIPBUF, containing accelerometer samples with scale factor Bl4, units pulses. Cells are all single precision, with program notations XOLDBUF, YOLDBUF, and ZOLDBUF respectively. Use same cells as \(\mathrm{ADOT}_{1}+1, \mathrm{ADOT}_{2}\), and \(\mathrm{ADOT}_{2}+1\) (for telemetry purposes): see Digital Autopilotsp RCS Routines.

XPIPBUF: Set of three consecutive erasable memory cells, scale factor Bl4, units pulses (accelerometer counts, uncompensated). Cells are all single precision, with program notations XPIPBUF, YPIPBUF, and ZPIPBUF respectively. Use same cells as \(\mathrm{ADOT}_{\mathrm{O}_{\mathrm{p}}}\), \(\mathrm{ADOT}_{0}+1\), and \({ }^{A D O T} I_{l_{s p}}\) (for telemetry purposes): see Digital Autop旺lot RCS
Routines. If Entry DAP is running(bit 12 of FLAGWRD6 = 1), loaded in "READACCS" with raw accelerometer sample, and updated 0.5, 1.0, and 1.5 seconds later with present accelerometer count (in "QUIKREAD"), with previous value of XPIPBUF being stored in XOLDBUF.

Verb 37 Major Mode Tables
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline Mode & Address & EBANK & DNLSTCOD & Mode & Address & EBANK & DNLSTCOD \\
\hline 00 & --- & - & 0 & 47 & "P47CSM" & 7 & 3 \\
\hline 01 & "GTSCPSS" & 5 & 0 & 51 & "P51" & 5 & 0 \\

\hline \multicolumn{8}{|l|}{*Table entries for P53 and P54 indicate starting addresses of "P53" and "P54" respectively, but these tags are defined to be equal to "P5I" and "PROG52", as shown.} \\
\hline \multicolumn{8}{|l|}{P81-P86 are control drivers for minimum key rendezvous cycling: they are not intended for manual selection.} \\
\hline
\end{tabular}

Rev. 0

RO2BOTH Entered from "P4OS/F" (P4O/P4I), "P47CSM", "PROG2O", "PROG22", "PROG24", "PROG52" (P52/P54), "S61.1" (P61/P62), and "V89CALL"

If bit 13 (REFSMFLG) of FLAGWRD3 \(=0\) :
If bit 9 (IMUOPBIT) of IMODES30 \(=0\) : (IMU turned on)
\[
\mathrm{TS}={\mathrm{O} 220_{\mathrm{g}}}
\]

If bit 9(IMUOPBIT) of IMODES30 \(=1\) :
\[
\mathrm{TS}=0210_{8}
\]

Perform "VARALARM"
Proceed to "GOTOPOOH"
Set bit 8 (IMUSE) of FLAGWRDO \(=1\)
Return

\section*{PIPASR}
\(T_{\text {pptml }}=T_{\text {now }}\)
Set least significant halves of \(D E L V=O\) (flag for telemetry that DELV not compensated)
Set \(D E L \underline{V}=P I P A\) and \(P I P A=-0\) PIPA reset so that no counts are lost. Only most significant halves of DELV loaded. Special precautions taken to make routine restartable: if get a restart, IdPIPADT set to \(K_{2 s e c p}\).

Return

\section*{I/PIPA}

If GCOMPSW < O, Return
Inhibit interrupts
Perform the following for \(i=z, y, x\) :
\[
\operatorname{DELV}_{i}=\text { DELV }_{i}+C_{\text {pipascf }}^{i} \text { DELV }_{i_{s p}}-C_{\text {pipabias }}^{i} \text { IdPIPADT }
\]

Release interrupts
\[
\begin{aligned}
& \operatorname{GCOMP}_{x}=\text { GCOMP }_{x}-C_{a d, x} \operatorname{DELV}_{x}+C_{s r, x} D_{y}-C_{n b d, x} \text { IdPIPADT } \\
& \operatorname{GCOMP}_{\mathrm{y}}=\operatorname{GCOMP}_{\mathrm{y}}-\mathrm{C}_{\mathrm{ad}, \mathrm{y}} \mathrm{DEL}_{\mathrm{y}}+\mathrm{C}_{\mathrm{sr}, \mathrm{y}} \mathrm{DEL}_{\mathrm{z}}-\mathrm{C}_{\mathrm{nbd}, \mathrm{y}} \text { IdPIPADT } \\
& \operatorname{GCOMP}_{z}=\operatorname{GCOMP}_{z}-C_{a d, z} \operatorname{DELV}_{z}-C_{s r, z} D E L V_{y}+C_{n b d, z} \text { IdPIPADT }
\end{aligned}
\]

If magnitude of any \(\mathrm{GCOMP}_{i}(i=x, y, z) \geqslant K_{\text {cpck }}\) :
Establish "l/CHECK" (priority \(21_{8}\) )
Return
NBDONLY Established by "SVCT3"
If GCOMPSW < 0, End of job
Inhibit interrupts
If bit 15(DRIFTFIG) of FLAGWRD2 \(=0\), End of job
Set \(\mathrm{TS}=1 \mathrm{dPIPADT}\) and \(\operatorname{ldPIPADT}=\) TIME1
Release interrupts
\(T S=\) ldPIPADT \(-T S \quad\) (i.e. new value minus old value)
Proceed to "NBD2"
LASTBIAS Established by "PREREAD"
Perform "PIPUSE"
If GCOMPSW < 0, End of job
\(T S=\left(\right.\) least significant half of \(\left.T_{p p t m l}\right)\) - ldPIPADT
ldPIPADT \(=K_{2 \text { secp }}\)
Proceed to "NBD2"
NBD2
If \(T S=0\), End of job
If \(T S<0\) :
\(\mathrm{TS}=\mathrm{TS}+16384\) centi-seconds (correct for TIMEI overflow)
\(\operatorname{GCOMP}_{\mathrm{x}}=\mathrm{GCOMP}_{\mathrm{x}}-\mathrm{C}_{\mathrm{nbd}, \mathrm{x}} \mathrm{TS} \quad\) (TS scaling here B19)
\(\operatorname{GCOMP}_{\mathrm{y}}=\operatorname{GCOMP}_{\mathrm{y}}-\mathrm{C}_{\mathrm{nbd}, \mathrm{y}} \mathrm{TS}\)
\(\operatorname{GCOMP}_{z}=\) GCOMP \(_{z}+C_{n b d, z} T S\)
If magnitude of any \(\operatorname{GCOMP}_{i}(i=x, y, z) \geqslant K_{\text {cpck }}\) :
Proceed to "I/GYRO"
End of job

\section*{1/CHECK}

If IMUCADR \(\neq 0\) :
End of job
Proceed to "I/GYRO"
1/GYRO
Shift GCOMP right 7 places (bits corresponding to \(2^{-8}\) pulses and below are lost), making scaling B21 pulses
\(T S=\) "GCOMP"
Perform "IMUPULSE"
Perform "IMUSTALL": if error return, proceed otherwise, proceed

Shift least significant half of GCOMP left 7 places, making scaling of double precision number (for most significant halves 0) B14 pulses. Bits \(14-8\) of least significant half lost (expected to be 0 for normal operation)

End of job
IMUMON Entered from "PROCEEDE" every 0.48 seconds
\(T S_{1}=\) (bits 15-11 and 9 of channel 30)
If \(\mathrm{TS}_{1}=\) (bits \(15-11\) and 9 of IMODES30):
Proceed to "TNONTEST"
\(T S=0 \quad\) (in RUPTREG2 cell)
Set those bits of \(\mathrm{TS}=1\) that are different in IMODES30 and \(\mathrm{TS}_{1}\) (in the range of bits \(15-11\) and 9)

Set (bits \(15-11\) and 9 of \(\operatorname{IMODES} 30\) ) \(=T S_{1}\)
If bit 15 of \(T S=1: \quad\) (IMU temperature)
TS = bits 14-1 of TS (Tag here "TLTM")
If bit 15(TLIMBIT) of \(\operatorname{IMODES30=1:~}\)
Set bit 4(Temperature Caution) of channel \(11=1\)
If bit 15(TLIMBIT) of IMODES30 \(=0\) :
If bit 1 (LMPTSTBT) of \(\operatorname{IMODES33}=0\) :
Set bit 4 (Temperature Caution) of channel \(11=0\)

If bit 14 of \(T S=1\) : (IMU turn-on request)

See also list of major variables and list of routines
ldPIPADT: Cell containing time information used with IMU compensation routines. During free-flight portions, contains value of TIMEl when previous gyro drift compensation was made, scale factor B14, units centi-seconds (with optional tag "OLDBTl"). During those portions of flight when "l/PIPA" is entered, contains value of computing interval, scale factor B8, units centi-seconds. Both quantities are single precision. Cell is set to 2 seconds in "Pll" and in "LASTBIAS", and to \(\frac{1}{2}\) second in "GTSCPSS".

ADRIGYR: Dummy quantity used to indicate that gyro compensation information taken from least significant ll bits of LGYRO. Bits ll-9 are loaded into EBANK (see Data Input/Output) and bits 8-1 are added to \(\mathrm{I}_{4} 00_{8}\) to give address within the erasable memory bank.
\(\mathrm{C}_{\mathrm{ad}}\) : Set of three single precision erasable memory constants, program notation "ADIAX", "ADIAY", and "ADIAZ", to correct for "IRIG acceleration sensitive drift along the input axis", scale factor B-3, units gyro pulses/accelerometer count. One gyro pulse is \(2^{-21}\) revolution and one accelerometer count is a velocity increment of 5.85 centimeters/second. The units of the constant can also be expressed as "meru/g", where one meru is \(10^{-3} \mathrm{x}\) earth rate. In these units, the scaling of the constant is about 19.0304345 least increments per (meru/g): this figure is \(2^{17}\) x 0.024339048 x ( \(5.85 \times 10^{-2}\) )/9.80665, where first term is the reciprocal of the least increment for units of gyro pulses/accelerometer count; the second term is the number of gyro pulses/meru ( 0.1 K Prelaunch Alignment); the third is the accelerometer omegns factor in units of meters/second; and the fourth is gravity (meters/sec \({ }^{2}\) ). If earth rate is simplified to 15 degrees/hour, the number of least increments per (meru/g) is reduced to about 18.9785.
\(C_{\text {nbd }}\) : Set of three single precision erasable memory constants, program notation "NBDX", "NBDY", and "NBDZ", to correct for "IRIG bias drift", scale factor B-5, units gyro pulses/centi-second. The units of the constant can also be expressed as "meru", in which case the scaling is about 127.606708 least increments per meru: this figure is \(2^{19} \times 0.01 \times 0.024339048\) (see \(C_{\text {ad }}\) : the 0.01 factor is for centi-seconds). For earth rate simplifad to 15 degrees/hour, the number of least increments per meru is reduced to about 127.2583.
\(C_{\text {pipabias }}\) : Set of three single precision erasable memory constants, program notation for first "PIPABIAS" (or "PBIASX", "PBIASY", and "PBIASZ"), to correct for "accelerometer bias", scale factor B-6, units accelerometer counts/centi-second. The units of the constant can also be expressed as "cm/sec \({ }^{21}\), in which case the scaling is about 1792.4376 least increments per \(\mathrm{cm} / \mathrm{sec}^{2}\) : this figure is \(2^{20} \times 0.01 \times(1 / 5.85)\), where first term is reciprocal of normal least increment, second compensates for centi-seconds,
and third is reciprocal of accelerometer scale factor. In-flight evaluation could be performed by determining the number of accelerometer counts accumulated in a period of 320 seconds, multiplying by two to give counts in ( \(2^{6} \times 10\) ) seconds, and then dividing by 1000 to give scaled counts/centi-second. N2l can be used to read PIPA cells and NOl with decimal input can be used to load the appropriate cells (1452, 1454, and 1456 in ECADR form for \(\mathrm{x}, \mathrm{y}, \mathrm{z}\) respectively).
\(C_{\text {pipascf }}\) : Set of three single precision erasable memory constants, program notation "PIPASCFX", "PIPASCFY", and "PIPASCFZ", scale factor B-9, units accelerometer counts/accelerometer count, used to correct for "accelerometer scale factor error." The units of the constant can also be expressed as "parts per million (PPM)", in which case the scaling is 8.388608 least increments per PPM: this figure is \(2^{23} \times 10^{-6}\), where first term is reciprocal of normal least increment and second is PPM conversion.
\(\mathrm{C}_{\text {Sr }}\) : Set of three single precision erasable memory constants, program notation "ADSRAX", "ADSRAY", and "ADSRAZ", to correct for "IRIG acceleration sensitive drift along the spin reference axis", scale factor B-3, units gyro pulses/accelerometer count. See discussion with \(\underline{\mathrm{C}}_{\text {ad }}\) (which has same scaling).
CDUXCMD (CDUXCMD, CDUYCMD, CDUZCMD): Single precision value of computer special erasable memory cells \(0050_{8}-0052_{8}\). Output pulses are generated based on the contents of these cells if bits 15-13 of channel 14 (respectively) are set 1 , and the respective IMU CDU error counter is loaded from the pulse train information if bit 6 of channel 12 is 1 . Pulses may be used to coarse align the IMU if bit 4 of channel 12 is set (in this case, IMU stable member movement causes the error counter information to be decremented), with \(2^{13}\) pulses giving one revolution. Pulses are generated at a rate of 3200 pps . See also Digital Autopilot Interface Routines.

COMMAND: Single precision value of required coarse-align command, scale factor Bl, units revolutions. Could also be considered (see above discussion of CDUiCMD) to have a scale factor B14, units coarsealign pulses.

DAPDATRI: See Digital Autopilot Interface Routines.
GCOMP: Value of required gyro compensation command, computed with a scale factor B14 but used in "IMUPULSE" with a scale factor B21 (or, alternatively, with a scale factor BO revolutions rather than B21 gyro pulses, since there are \(2^{21}\) gyro pulses/revolution).

GCOMPSW: Single precision control cell used to bypass the performance of "l/PIPA" and "NBDONLY" if is negative. Set 0 in "GTSCPSS".

GYROCMD: Single precision value of computer special erasable memory cell 0047 , used to control generation of. gyro torquing pulses at a \(3200^{\circ}\) pps rate if bit 10 of channel \(14=1\). Gyro power supply for the pulses is enabled by bit 6 of channel 14, bits \(8-7\) indicate the axis, and bit 9 is 1 if a negative command is to be produced. One pulse is \(2^{-21}\) revolution.

IMODES30: Single precision flag word used for control of "TLRUPT" routines associated with channel 30 inputs. Individual bits have the meanings given below. A restart ("GOPROG") sets bits 14-10 to 1 and sets bits \(15,8-6\), and 2 to 0.

Bit Symbol
15 TLIMBIT

14 TONISSBT

13 IMUFLBIT

12 ICDUFLBT

11 CAGEBIT

10 PIPAFLBT

9 IMUOPBIT

8 ITNON2BT

7 ITNON1BT

6 IMUNITBT

5 NOACCALM

4 IMUFINH

\section*{Meaning}

Last sampled value of channel 30 bit 15 ( O if stable member within designed temperature limits).

Last sampled value of channel 30 bit 14 ( 0 if ISS has been turned on or commanded to be turned on).

Last sampled value of channel 30 bit 13 ( 0 if an IMU fail indication has been produced by the IMU hardware).

Last sampled value of channel 30 bit 12 ( 0 if an IMU CDU fail indication has been generated by the IMU CDU hardware).

Last sampled value of channel 30 bit ll ( 0 if an IMU cage command generated by the crew).

Same as bit 13 of IMODES33 ( 0 if an accelerometer fail indication produced by the hardware, channel 33 bit 13).

Last sampled value of channel 30 bit 9 ( 0 if IMU turned on and operating with no malfunctions).

Bit 7 of IMODES30 sensed as 1 (i.e. turn-on request received). Used to achieve a wait of 0.48 seconds (during which bit is 1) before acting on turn-on information.

IMU turn-on request received (a change in value to a logic l, i.e. binary 0 , of bit 14 or bit 9 of IMODES30).

Bit set 1 to indicate that IMU use should not be attempted: set l during the turn-on sequence, if bit ll of IMODES30 indicates a cage command, or ISS zeroing in "TLRUPT" loop.

Bit set 1 to inhibit generation of program alarm 212 g in "C33TEST" (for accelerometer fail signal).

Bit set 1 to inhibit generation of ISS Warning signal based on IMU fail signal (bit 13 of IMODES30).

Bit Symbol
3 ICDUINHTT

2 DLAYFAIL

1 ACCFINHT

\section*{Meaning}

Bit set l to inhibit generation of ISS Warning signal based on receipt of IMU CDU fail signal (bit 12 of IMODES30).

Bit set \(l\) to indicate failure of the turn-on delay sequence (IMU turn-on signals not present for the required time interval).

Bit set 1 to inhibit generation of ISS Warning signal based on receipt of accelerometer fail signal (bit 10 of IMODES30).

IMODES33: Single precision flag word used for control of "TLRUPT" routines associated with chánnel 33 inputs (and other functions). Individual bits have the following meanings.

\section*{Bit Symbol}

14 PROCDBIT

13 PIP2FLBT

12 DNLKFAIL

11 UPLKFAIL

6 NOIMUDAP

5 IMUZROBT

1 LMPTSTBT

\section*{Meaning}

Last sampled value of channel 32 bit 14 ( 0 if a Proceed pushbutton command given). This bit is used in "PROCEEDE".

Last sampled value of channel 33 bit 13 ( 0 if an accelerometer fail indication has been produced by the hardware).

Last sampled value of channel 33 bit 12 ( 0 if telemetry end pulse rejected, downlink too fast).

Last sampled value of channel 33 bit 11 ( 0 if uplink pulse rejected, uplink too fast).

Bit set 1 to indicate that IMU use for vehicle attitude information should not be attempted (sensed by RCS DAP and Entry DAP).

IMUCADR: Cell containing control information used in association with "IMUSTALL": it contains return address information from the routine or information on the success (if \(=-1\) ) or failure (if \(=-0\) ) of an IMU function.
\(K_{2 \text { secp }}\) : Single precision constant, program notation "PRIO3l", octal value 31000 , scale factor B8, units centi-seconds. Value corresponds to 2 seconds.
\(K_{\text {btl0 }}\) : Single precision constant, program notation "BITIO", scale factor BO, units centi-seconds/gyro torquing pulse. Value is \(2^{-5}\) (i.e. \(1 / 32\) ), since output pulse rate is 3200 pps , or 32 pulses/centi-second.
\(K_{\text {corst }}\) : Single precision constant, program notation "COARSTOL", scale factor B-l, units revolutions. Octal value is \(7^{77511_{8}}\), which corresponds (after a one-bit modification used in the program for convenience in forming the absolute value) to about \(-2.0105^{\circ}\).
\(K_{\text {cpck: }}\) : Single precision constant, program notation "NEGONE", scale factor B14, units gyro pulses, used to check if compensation of gyros is required. Octal value is \(77776_{\text {, }}\), but used in the program in such a way (a mask on decremented |GCOMP \({ }_{i}\) !) that effective value corresponds to 3 pulses: the most significant half of \(\mathrm{GCOMP}_{i}\) must be 3 or more pulses for the "l/GYRO" computations to be initiated, although lack of sign agreement could make the actual value only slightly more than 2 pulses.
\(K_{\text {gyrfrc }}\) : Constant, program notation "GYROFRAC", scale factor B2l, units gyro pulses. Stored value is \(28 \times 2^{-28}\), corresponding to about 0.219 pulses (nominal value 0.215 ).
\(K_{\text {gyrsc }}\) : Dummy constant indicating a rescaling of original contents of \({ }^{\text {E ADRLGYR }}\) from B21 to B28 pulses. "Value" is 1.0, scale factor \(B 7\).
\(K_{\text {ml5degs }}:\) Single precision constant, program notation "-15DEGS", scale factor B-1, units revolutions. Octal value is 75252g, corresponding to about \(-14.996^{\circ}\).
 factor B-l, units revolutions. Octal value is 634348 , corresponding to about \(-70.005^{\circ}\) (after a one-bit modification used in the program for convenience in forming the absolute value).
\(K_{\text {mcmxm }}\) : Single precision constant, program notation "-COMMAX-", scale factor \(\mathrm{Bl}_{4}\), units CDU output pulses. Value is \(-192 \times 2^{-14}\).
\(K_{\text {mcommax }}:\) Single precision constant, program notation "-COMMAX", scale factor B14, units CDU output pulses. Value is \(-191 \times 2^{-14}\), but used in program (for convenience in forming the absolute value) in such a way that effective value is -192. Limits change in CDU angle to 192 least increments per axis (or \(8.4375^{\circ}\) ) each 0.6 seconds. The maximum pulses required (to go 180 degrees) would be 4096, which would require " 21.3333 ", i.e. 22 intervals of 0.6 seconds each. With the additional 1.5 seconds for the \(\mathrm{K}_{\text {corst }}\) check, time required for coarse align would be less than about \(0.06+0.02+22(0.6)+1.5\), or 14.78 seconds.
\(K_{\text {mgyrmn }}\) : Single precision constant, program notation "-GYROMIN", scale factor B7, units gyro pulses. Octal value is \(77601_{8}\), which corresponds (after a one-bit adjustment used in program for convenience in forming the absolute value) to ( \(-127 / 128\) ), i.e. one least increment less than 1.00 gyro pulse.

LGYRO: Cell containing (if non-zero) address information for gyro torquing commands. If cell is zero, gyros are "available" (i.e. not being driven).

PIPA: Value of special erasable memory cells ( \(0037_{8}-004 l_{8}\) ) containing accumulated output counts from the accelerometers, scale factor B14, units counts. One count is 5.85 centimeters/second.

Tpptml: Value of computer clock when accelerometers sampled, program notation "PIPTIME1", scale factor B28, units centi-seconds. Subsequently loaded into \(T_{p p t m}\), hence can also be used as storage for the time tag associated with \(\underline{R}_{n l}\) and \(\underline{V}_{n l}\) (see General Program Control) for use by "PREREAD".

Proceed to second line of "GOTOPOOH"
Proceed to "R51K"
217ALARM
Inhibit interrupts
ALMCADR = "Calling address +1 " (S-register portion)
Perform "ALARM2" (pattern \(021{ }_{8}\) )
Return (address in ALMCADR)

See also list of major variables and list of routines
ldPIPADT: See IMU Computations.
ALMCADR: See General Program Control.
ALPHAV: See Coordinate Transformations.
ALT: See Coordinate Transformations.
BESTI: Single precision value of index parameter for star \#l of the "best" star pair (as determined by "P52C" computations), scale factor B14. It will be zero if no star pairs found that are satisfactory, and otherwise will be equal to six times the "star number" (see \(\underline{K}_{\text {cat }}\) ) when loaded in "P52C" computations. See BESTJ.

BESTJ: Single precision value of index parameter for star \#2 of the "best" star pair (as determined by "P52C" computations), scale factor B14. It will be zero if no star pairs found that are satisfactory, and otherwise will be equal to six times the "star number" (see \(\underline{K}_{\text {cat }}\) ) when loaded in "P52C" computations. Unless it is zero, it will be less than BESTI as loaded in "P52C" computations. In P52/P54, it is loaded with (STARCODE x 6), see "PLANET", for the first body that is used, while BESTI has the second; in P51/P53, however, it contains (STARCODE x 6) for the second body, while BESTI has the first. In either case, however, BESTJ will contain the body code associated with the sighting data for which the address selected in "SXTSM" is MARK2DWN. "BESTJ" \(=\) "BESTI" +1 。

CDUSPOT: See Coordinate Transformations.
CEARTH: Value of the cosine of the minimum angle between the star and VEARTH allowed in "P52C" logic (i.e. in "OCCULT"), scale factor B2, computed in "S50". It is stored in push-down list location 14D, which also has notation "CSS".

CMOON: Value of the cosine of the minimum angle between the star and VMOON allowed in "OCCULT", scale factor B2, computed in "S50". It is stored in push-down list location 18D.

CSUN: Value of the cosine of the minimum angle between the star and VSUN allowed in "OCCULT", scale factor B2, set to K cssun in "S50" (a "variable" for indexing convenience in "OCCULT"). \({ }^{\text {cssun }}\) It is stored in push-down list location 16D.

GCOMP: See IMU Computations.
IMODES30: See IMU Computations.
IMUCADR: See IMU Computations.
\(K_{\text {ldc }}\) : Constant, program notation " \(1 / \mathrm{C}\) ", scale \(\mathrm{f}_{7}\) factor B-6, value \(4.2696 \mathrm{E}-5 \times 2^{-1}\). Value corresponds to \(2^{7} /\left(9.835712 \mathrm{E} 8 \times 10^{-2} \mathrm{x}\right.\) 0.3048 ), where first term (numerator) combines the B-6 scale factor and the \(2^{-1}\) for constant, second is velocity of light (fps), third converts to centi-seconds, and 4 th converts to meters, giving the 4.2696E-5.
\(K_{\text {Idsqrt3 }}\) : Constant, program notation "I/SQR3", scale factor BO, value the reciprocal of \(\sqrt{3}\). Used in "PLANET" to ensure no overflow for unit.
\(K_{5 \text { degs }}:\) Constant, program notation "5DEGREES", scale factor BO, units revolutions. Value is 0.013888889 , corresponding to 5 degrees.
\(K_{\text {cat }}\) : Table of positions of 37 stars, program notation "CATLOG", stored as the \(\mathrm{X}, \mathrm{Y}\), and Z components of a unit vector, scale factor Bl. The index for the table equals six times the star serial number (since each component is double precision, six cells per star are used). See table below. Because of the nature of the interpretive index order (subtractive), the tag "CATLOG" actually is one cell after the least significant half of the \(z\) component of star \#l, and \#l is the star with highest memory address.
\(K_{\cos 33}\) : Constant, program notation "COS33", scale factor BO, value 0.8431756920 . Value corresponds to cosine of \(32^{\circ} 31^{\prime} 23.19^{\prime \prime}\), the same angle as that used with [NB1NB2] (see Coordinate Transformations).
\(K_{\text {css } 5}\) : Constant, program notation "CSS5", scale factor B2, value 0.2490475. True value is 0.99619 , corresponding to cosine \(5^{\circ}\).
\(K_{\text {css33 }}\) : Constant, program notation "CSS33", scale factor B2, value css \(33^{\circ} 0.197002688\). True value is \(0.788010^{\prime} 752\), corresponding to cosine \(38^{\circ}\) (one half the angle reflected in \(\mathrm{K}_{\text {css } 66 \text {, }}\), hence the notation).
\(K_{\text {css66 }}\) : Constant, program notation "CSS66", scale factor B2, value 0.060480472 . True value is 0.241921888 , corresponding to \(\cos 76^{\circ}\) (angle gate was formerly \(66^{\circ}\), hence the notation).
\(\mathrm{K}_{\text {css } 6640}\) : Constant, program notation "CSS6640", scale factor B2, to \(0.241921888-0.866025368\), or (cosine \(76^{\circ}-\) cosine \(30^{\circ}\) ). Angle gates were formerly \(66^{\circ}\) and \(40^{\circ}\), hence the notation.
\(K_{\text {cssun }}\) : Constant, program notation "CSSUN", scale factor B2, value 0.24148 . True value is 0.96592 , corresponding to cosine \(15^{\circ}\).
\(K_{\text {degl }}\) : Constant, program notation "DEGREFI", scale factor BO, units revolutions. Octal value is \(00056_{8} 37722_{g}\), corresponding to about \(1.033^{\circ}\).
\(K_{\text {deg359: Constant, program notation "DEG3559", scale factor BO, units }}\) revolutions. Octal value is \(37722_{8} 00004_{8}\), corresponding to about \(358.9893^{\circ}\). The single precision versions of this constant and \(K_{\text {degl }}\) sum to one revolution.
\(K_{\text {eclipol }}\) : Vector constant, program notation "ECLIPOL", scale factor BO, approximately to \(0.993674 \mathrm{E}-4\) ( \(0,-0.3978364,0.9174565\) ), where terms in parentheses are \(-\sin K_{b s u b o}\) and cos \(K_{\text {bsubo }}\) (see Coordinate Transformations), and first term is the radian equivalent of about 20.496 arc seconds (the constant of aberration).
\(K_{\text {rsube }}:\) Constant, program notation "RSUBE", scale factor B29, units meters. Value is \(6378166 \times 2^{-29}\), the Fischer equatorial radius.
\(K_{\text {rsubm }}\) : Constant, program notation "RSUBM", scale factor B29, units meters. Value is \(1738090 \times 2^{-29}\), the mean lunar radius.
\(K_{\text {sin }} 33\) : Constant, program notation "SIN33", scale factor BO, value \(0.537638124 l^{1}\). Value is the sine of the angle discussed for \(K_{\cos 33^{\circ}}\)
\(\mathrm{K}_{\text {tsgtI }}\) : Constant, program notation "TSIGHT1"", scale factor B28, units centi-seconds. Value is \(24000 \times 2^{-28}\), corresponding to 240 seconds.

LANDALT, LANDLONG: See Orbital and Rendezvous Navigation.
LONG: See Coordinate Transformations.
MARK2DWN+i (i \(=0-6\) ): Set of optics mark information (double precision time, CDU, optics shaft, \(\mathrm{CDU}_{z}\), optics trunnion, and \(\mathrm{CDU}_{\mathrm{x}}\) respectively) loaded for downlink purposes from alignment mark for the body identified by BESTJ (loaded in "SXTSM").

MARKDOWN+i (i = 0-6): See Measurement Incorporation.
MRKBUF1: See Optics Computations.
OGC: See Coordinate Transformations.
OPTION2: See Display Interface Routines.
OPTNTYPE: See Orbital and Rendezvous Navigation.
PLANVEC: Temporary storage for the output of the "PLANET" routine for the first body that is marked, scale factor Bl. In P51/P53 it is in reference coordinates, while in P52/P54 it is converted to IMU coordinates before being stored.

RLS: See Coordinate Transformations.
SAX: Unit vector, scale factor Bl, giving the direction of the optics shaft axis: stars are considered visible (for selection purposes) if they lie within \(38^{\circ}\) of this axis. The quantity is expressed in the reference coordinate system.

STARAC, STARAD, STARBC, STARBD: See Coordinate Transformations.
STARCODE: Single precision cell, scale factor B14, displayed in Rl by N7O/ NYl, and used to contain the serial number of the celestial body being sighted ( 0 for "planet", N88 input; 01-45 for star in \(K\) cat; 46 for sun; 47 for earth; and 50 for moon). Six times this number (for double precision vector indexing reasons) is stored in BESTI or BESTJ.

STARIND: Single precision cell, scale factor B14, used to cause two stars to be processed (or other bodies). If it is l, BESTJ is used; if 0, BESTI. Initialized to 0 in "P51B" (P51/P53) for first body and incremented to 1 for second; initialized to 1 in "R5l" (P52/P54) for first body and decremented to 0 for second. Also 0 in "ROO".

STARSAV1: Temporary storage for sighting information (unit vector in IMU coordinates), scale factor Bl. Loaded in "P51B" with sighting vector to first body; in "R5l", loaded briefly with referencecoordinate information (from "PLANET") for first body, and then loaded with sighting vector to first body. The referencecoordinate information is used in R52 for optics pointing purposes.

STARSAV2: Temporary storage for sighting information (unit vector in IMU coordinates), scale factor Bl. See STARSAV1 (STARSAV2 information is for second body instead of first, of course).

STARSAV3: Cells used by N88 for retention of "planet" information. N88 treats decimal input as double precision fraction, and since a unit vector is formed before quantity used (with components previously multiplied by K \({ }_{\text {dsart3 }}\) ), the DSKY input can be with arbitrary (but consistent) scalingre

T sight: Value of sighting time, scale factor B28, units centi-seconds. It is loaded in "SXTSM" with the time at which the optics mark was made (for use in "PLANET" for computing earth, moon, or sun positions at that time in "S50" if required). It is also used in "P52B" to retain the input time for computation of the landingsite orientation, and in "P52C" to contain present time incremented by \(\mathrm{K}_{\text {tsgtl }}\) for "S50" use in determining "OCCULT" body positions.
VEARTH: Quantity computed in "S50" as the earth position (scale factor \(\bar{B} 1\), a unit vector, when exit from routine) at time \(T\). It has storage address the same as"STARAD"(hence at startitght "PLANET", VSUN and VEARTH are traded as far as storage locations are concerned, for convenience in subsequent indexing).

VELdC: Vector, scale factor Bl, giving "aberration correction vector" (see K \({ }_{\text {eclipol }}\) )defined as "velocity of vehicle with respect to sun divided by velocity of light." It is computed in "S50" and used in "PLANET". Also computed and used in "UTAREAl".

VMOON: Quantity computed in "S50" as the moon position (scale factor Bl, a unit vector, when exit from routine) at time \(\mathrm{T}_{\text {sight. }}\). It has storage address the same as "STARAD" +12 .

VSUN: Quantity computed in "S50" as the sun position (scale factor \(B 1\), a unit vector, when exit from routine) at time \(T\) sight. It has storage address the same as "STARAD" +6 (see VEARTR \({ }^{\text {( }}\) ).
\(\underline{X}_{\text {smd }}, \underline{Y}_{\text {smd }}, \underline{Z}_{\text {smd }}\) : Unit vectors, scale factor Bl, giving desired stable member orientation. Loaded by "P52B" or "S40.2,3(B)", or can be loaded by P27 ( \(\underline{X}_{\text {smd }}\) address is 0306 g, the same as "UPBUFF" +2 ).
\begin{tabular}{|c|c|c|c|c|c|}

\end{tabular}

The "Display" column gives the star number that is displayed by the program (as an octal quantity). The "Index" column gives the value of BESTI (or BESTJ) for the corresponding star, and is equal to six times the star serial number (i.e. six times the decimal equivalent of the first column).

A display of 00 indicates an N88 input; displays of 46,47 , and 50 are for sun, earth, and moon respectively.

\section*{Mathematical Functions}

\section*{Sine}

\(\mathrm{MPAC}_{\mathrm{dp}}=\mathrm{TS}\)
Return
Single Precision Sine ( \(\sin _{s p}\) )

Routine entered with argument in computer hardware accumulator, ACC, single precision, scale factor B-l, units revolutions. Leaves sine in hardware accumulator, scale factor BO .
\(X=A C C\)
Perform "SPSICOM"
\(\mathrm{ACC}=\mathrm{TS}\)

Return

SPSICOM
If \(|X| \geqslant \frac{1}{4}, \quad X=\frac{1}{2} \operatorname{sgn} X-X\)
If \(|x| \geqslant \frac{1}{4}\) :
\[
\mathrm{TS}=\mathrm{MAX} \operatorname{sgn} \mathrm{X}
\]

Return
\(x=X\), rescaled to scale factor \(B-2\) revolutions, i.e. \(B O\) in \((\pi / 2)\) units.
\(T S=K_{c l s p} x+K_{c 3 s p} x^{3}+K_{c 5 s p} x^{5}\), limited in magnitude \(<1\)
Return
\begin{tabular}{ccccc} 
Constant & Nominal Value & & Stored Value & \\
\(\mathrm{K}_{\text {clsp }}\) & 0.7853134 & & 0.78533935 & 0.999925 \\
\(\mathrm{~K}_{\mathrm{c} 3 \mathrm{sp}}\) & \(-0.321614^{r} 7\) & -0.32159423 & -0.165951 \\
\(\mathrm{~K}_{\text {c5sp }}\) & 0.0363551 & 0.03637695 & 0.007608
\end{tabular}

All constants have scale factor \(B l\), for \(\pi / 2\) units.
\[
\text { Single Precision Cosine ( } \cos _{\text {sp }} \text { ) }
\]

Routine entered with argument in computer hardware accumulator, ACC, single precision, scale factor \(B-1\), units revolutions. Leaves cosine in hardware accumulator, scale factor BO.
\(X=A C C+\frac{1}{4}\)
If \(|X| \geqslant \frac{1}{2}:\)
\[
X=-\left(X-\frac{1}{2} \operatorname{sgn} X\right)
\]

Perform "SPSICOM"
\(A C C=T S\)
Return

\section*{Arc Sine}

Routine entered with argument in \(\mathrm{MPAC}_{t p}\), scale factor Bl . Leaves
\(M_{M P A C}\) dp with arc sine of argument, scale factor BO, units revolutions, in range \(\pm \frac{1}{4}\) (i.e. \(\pm 90^{\circ}\) ).
\(X=M P A C_{t p}\)
Perform "ARCCOM"
MPAC \(_{\mathrm{dp}}=\frac{1}{4}-\mathrm{TS}\)
Return
ARCCOM
If \(|X|=0, T S=\frac{1}{4} ;\) Return
\(\mathrm{TS}_{1}=\mathrm{X}\)
\(X=|X|\)
If \(X \geqslant\left(1+2^{-12}\right)\), or 1.000244 , or if least significant half of \(X\) is negative and \(X>\left(1+2^{-13}\right)\), or 1.000122 :

Perform "ALARM" (pattern 13018 )
If \(X \geqslant 1\), set \(T S=0\) (for \(T S_{1}\) positive) or \(T S=\frac{1}{2}\) (for \(T S_{1}\) negative); Return
\(T S=(1-X)^{\frac{1}{2}} \quad\) (scale factor \(B 1\) when enter square root routine)
\(T S=T S\left(K_{a s O}+K_{a s 1} X+K_{a s 2} X^{2}+K_{a s 3} X^{3}+K_{a s 4} X^{4}+K_{a s 5} X^{5}+\right.\) \(\left.K_{a s 6} X^{6}+K_{a s 7} X^{7}\right)\)

If \(T S_{1}\) negative, \(T S=\frac{1}{2}-T S\)
Return
\begin{tabular}{|c|c|c|}
\hline Constant & True Value & \(\sqrt{2} \pi \times\) True Value \\
\hline \(\mathrm{K}_{\mathrm{as} 0}\) & 0.353553385 & 1.570796302 \\
\hline \(\mathrm{K}_{\text {as }}\) & -0.04830 17006 & -0.214598801 \\
\hline \(\mathrm{K}_{\text {as2 }}\) & 0.0200273085 & 0.088978987 \\
\hline \(\mathrm{K}_{\text {as3 }}\) & -0.01129 31863 & -0.05017 4305 \\
\hline \(\mathrm{K}_{\text {as4 }}\) & 0.00695311612 & 0.030891881 \\
\hline \(\mathrm{K}_{\text {a,5 }}\) & -0.00384 617957 & -0.01708 8126 \\
\hline \(\mathrm{K}_{\text {as6 }}\) & 0.001501297736 & 0.006670090 \\
\hline \(\mathrm{K}_{\mathrm{as}}{ }^{\prime}\) & -0.00028 4160334 & -0.00126 2491 \\
\hline
\end{tabular}

All constants are stored with scale factor B-I in program (e.g. \(K_{\text {as }}\) has scale factor \(B-5\) ); the \(\sqrt{2}\) factor is required because \((1-X)\) is scaled at Bl when take its square root. The numbers in the last column agree closely with published Hastings series values.

Arc Cosine
Routine entered with argument in MPAC \({ }_{t p}\), scale factor Bl. Leaves \(M_{P A C}\) with arc cosine of argument, scale factor BO, units revolutions, in range \(0-\frac{1}{2}\left(\right.\) i.e. \(\left.0^{\circ}-180^{\circ}\right)\).
\(X=M P A C_{t p}\)
Perform "ARCCOM"
\(M_{P A C}{ }_{\mathrm{dp}}=T S\)
Return

\section*{Square Root}

Routine entered with argument in MPAC \({ }_{\text {tp }}\), and with scale factor (in general) an even number. Leaves MPAC tp with square root of argument, having scale factor one-half the scale factor of argument (a \(\sqrt{2}\) factor must be accounted for elsewhere if the scale factor was odd when enter the routine).
\[
X=M P A C_{t p} \text {, considered to have scale factor } B O
\]

If \(X=0, M P A C C_{t p}=0\); Return
If \(\mathrm{X}<-2^{-14}\), proceed to "POODOO" (pattern \(21302_{8}\) )
If \(X<0, M P A C_{d p}=0\); Return
TS \(=\mathrm{X}\), normalized to lie between \(\frac{1}{4}\) and \(<1\). This is accomplished by shifting \(X\) left in increments of 2 shifts, and storing the required number of shifts in \(\mathrm{TS}_{1}\) (an even number \(\geqslant 0\) )

If \(\quad \mathrm{TS} \geqslant \frac{1}{2}, \quad \mathrm{TS}_{2}=0.5884 \mathrm{TS}_{\mathrm{sp}}+0.4192\)
If \(\mathrm{TS} \leqslant \frac{1}{2}, \quad \mathrm{TS}_{2}=0.8324 \mathrm{TS}_{\mathrm{sp}}+0.2974\)
\(T S_{2}=\left(\frac{1}{2} T S_{S p}\right) / T S_{2}+\frac{1}{2} \mathrm{TS}_{2} \quad\) ( \(\mathrm{TS}_{2}\) single precision)
\(T S=\frac{1}{2} \mathrm{TS}_{2}+\frac{1}{2} \mathrm{TS} / \mathrm{TS}_{2}\)
If \(T S \geqslant 1, \quad T S=\left(1-2^{-28}\right)\)
MPAC \(_{t p}=T S\), shifted right by ( \(\frac{1}{2} T S_{1}\) ) places
Return
\[
\text { Natural Logarithm }\left(\log _{\mathrm{e}}\right)
\]

This routine is entered from "RANGER", with the argument in MPAC scale factor BO. It leaves the natural logarithm of the reciprocal of the argument (or the complement of the logarithm of the argument) in MPAC \({ }_{d p}\), scale factor \(B 5\).

\section*{LOG}
\(T S=M P A C_{d p}\), normalized to lie between \(\frac{1}{2}\) and \(<1\). This is accomplished by shifting MPAC \(_{d p}\) left and storing the required number of shifts in \(\mathrm{TS}_{1}\) (a number \(\geqslant 0\) ).
\(X=1-T S \quad\) (The "l" actually is \(1-2^{-28}\) )
\(M P A C_{d p}=K_{\operatorname{cog} 1} T S_{1}+K_{o g 1} X+K_{o g 2} X^{2}+K_{o g 3} X^{3}\)
Return (with value of \(-\log _{e}\) of original \(M P A C{ }_{d p}\) )
All constants are stored with scale factor B5. The value of \(K_{\mathrm{cog} ~}\) corresponds to \(\log _{\mathrm{e}} 2\).
\begin{tabular}{|c|c|c|}
\hline Constant & Stored Value & True Value \\
\hline \(\mathrm{K}_{\operatorname{cogl}}\) & 0.0216608494 & 0.69314718056 \\
\hline \(\mathrm{K}_{\mathrm{og} 1}\) & 0.031335467 & 1.00273494 \\
\hline \(\mathrm{K}_{\mathrm{og} 2}\) & 0.0130145859 & 0.4164667488 \\
\hline K og 3 & 0.0215738898 & 0.6903644736 \\
\hline

\section*{Quantities in Computations}

See also list of major variables and list of routines

22SUBSCL: Single precision cell used in "P23N707l" to retain the verb-noun pattern used. Same cell also used in P22 (see Orbital and Rendezvous Navigation).

9DWI: Cell used single precision, scale factor Bl3, to control performance of routine to convert \(W\) matrix from \(6 \times 9\) to \(6 \times 6\). It is stored in push-down list location 10D.

9DWJ: Cell used single precision, scale factor Bl3, to control performance of routine to convert \(W\) matrix from \(6 x 9\) to \(6 \times 6\). It is stored in push-down list location 14D.

9DWN: Cell used single precision, scale factor Bl3, to control performance of routine to convert \(W\) matrix from \(5 x 9\) to \(6 x 6\). It is stored in push-down list location 12D.

9DWP: Cell used single precision, scale factor B13, to control performance of routine to convert \(W\) matrix from \(6 x 9\) to \(6 \times 6\). It is stored in push-down list location 8D.

9DWXX: Single precision cell used to retain return address information from "9DWTO6DW".

AGEOFW: Time of last \(W\) matrix initialization for rendezvous, scale factor B28, units centi-seconds. Set equal to MARKTIME in "REND5C", and can be displayed by noun 31. Used in "AUTOW" logic.

ALPHAV: See Coordinate Transformations.
BESTI: See Inflight Alignment.
BVECTOR \({\underset{O}{0}}, \mathrm{BVECTO}_{1}, \mathrm{BVECTO}_{2}\) : Vectors used as communication cells with "INCORPI" to provide geometry information associated with DELTAQ, i.e. relating the deviation in the measurement (a scalar) to the vector deviation in the state vector. The three vectors can be considered associated with position, velocity, and landmark location, and in the CSM program BVECTOR \({ }^{7}\) is always set 0 . Scale factors of BVECTOR \(\underline{R}_{0}\) and \(\operatorname{BVECTO} \underline{R}_{2}\) (non-zero only in P22) are Bl.

Caltvar: Single precision erasable memory constant, program notation
"ALTVAR", scale factor B-16, units rad\({ }^{2}\), used in "REND7" (part of R22) if optics backup (R23) data is used, to specify information on the a priori accuracy of the backup optics data.
\(C_{\text {horislp }}\) : Erasable memory (double precision) constant, program notation " of "horizon altitude" (it is multiplied by \(|R Z \underline{C}|\) and then subtracted from the other terms).
\(C_{\text {horizalt }}\) : Erasable memory (double precision) constant, program notation "HORIZALT", scale factor B29, units meters, used in "HORIZ" (part of P23) to determine the "horizon altitude".

Cintvar: Single precision erasable memory constant, program notation "INTVAR", scale factor Bl5, units meters \({ }^{2}\), added to the variance computed in "REND7" (part of R22) for "integration variance", i.e. "square of expected integration position extrapolation error".
\(C_{\text {rmax }}\) : Single precision erasable memory constant, program notation "RMAX", scale factor B19, units meters, giving the maximum value of position state vector change (as expressed in N49DISP) that is incorporated automatically by R22. Values larger than this constant cause a display for crew approval. If it is desired to generate a display for all measurement information, this can be accomplished by setting the constant to \(77776_{8}\) (one bit negative).
\(C_{r v a r}\) : Erasable memory (double precision) constant, program notation "RVAR", scale factor B-16, giving the "percentage error" (squared) in the VHF ranging measurement: for VHF marks, (|RCLP|) \({ }^{2} \mathrm{C}^{+}{ }^{+}\) \(C_{\text {intvar }}\) is the value of VARIANCE (subject to \(C_{\text {rvarmin }}\) cons \(£ \begin{aligned} \text { rainnt) }\end{aligned}\) Actually would involve "percent"/100, of course.
\(\mathrm{C}_{\text {rvarmin }}\) : Triple precision erasable memory constant, program notation "RVARMIN", scale factor B4O, units meters 2 , giving the negative of the minimum value of VARIANCE for the VHF range measurements in R22 (negative is for coding convenience). If the most significant one-third of the constant is zero, then the least significant twothirds can be considered as a double precision number, scale factor B26. If set very large, effectively inhibits use of VHF data(for \(W\) small).

Cunitw: See General Program Control.
\(\mathrm{C}_{\text {veso }}\) : See Coordinate Transformations.
\(C_{\text {vmax }}\) : Single precision erasable memory constant, program notation "VMAX", scale factor B7, units meters/centi-second, giving the maximum value of velocity state vector change (as expressed in N49DISP+2) that is incorporated automatically by R22. Values larger than this constant cause a display for crew approval.

CADRFLSH+2: See Display Interface Routines.
COSQ: Cosine of angle between USSTAR and UCISTAR, scale factor Bl, stored in push-duwr list location OD.

COUNT3MK: See Minimum Key Rendezvous.
CSMPOS: Value of CSM position vector, scale factor B29(earth) or B27 (moon), units meters.

DELQDA: Value of DELTAQ/TRIPA, variable scale factor, stored in pushdown list location OD. If numerator and denominator are already normalized, scale factor is B-10 for earth or B-12 for moon.

DELTAQ: Value of deviation in measurement quantity, scale factor B29(earth) or B27(moon), units meters.

DELTAV \(\underline{c m}^{\text {cm }}\), DELTAV \(\underline{-l m}\) : See Orbital Integration. Component overflows if exceeds \(2^{22}\) meters (earth) or \(2^{18}\) meters (moon).

DELTAX \(_{-}\), DELTAX \(_{1}\), DELTAX \(_{2}\) : State vector deviation estimates, scale factor (for DELTAX \(=_{0}\) and DELTAX \({ }_{2}\) ) B29(earth) or B27(moon), units meters; for DELTAX , scale factor B7(earth) or B5(moon), units meters/centi-second. They are for position of vehicle, velocity of vehicle, and position of landmark respectively ( \(i=0,1,2\) ).

EGRESS: Single precision cell used for storage of return address information from "INCORP2" routine.

EMATRIX \({ }_{i}\) : Temporary storage cells used to store intermediaie results from the conversion of W matrix from \(6 \times 9\) to \(6 \times 6\). The cells used in the memory for this function correspond to \(W_{60}-W_{80}\), but separate notation is used (as in the program) for clarity.

ERADM: See Coordinate Transformations.
GAMMA: Quantity computed in "INCORPI", variable scale factor (scale factor information partially contained in cell NORMGAM). If NORMGAM \(=0\), scale factor of GAMMA equivalent to B-40. NORMGAM subsequently modified to reflect rescaling of \(\underline{Z}_{i}\) (for use in "INCORP2").

HORIZON: Single precision quantity loaded and displayed in R3 of N7O and N7l, used only in P23 (see "P23N7071"). If LANDMARK is non-zero, then HORIZON must be zero; if LANDMARK \(=0\), then HORIZON checked to be of the form XXCDX, where \(C=1\) means earth and \(C=2\) means lunar (other values not allowed); \(D=1\) means near horizon and \(D=2\) means far horizon (other values not allowed). If an illegal input is detected (the X's may be of any value, provided LANDMARK \(=0\) ), then the display is generated again, after energizing the operator error light.
\(K_{\text {ldsqr3 }}:\) Constant, program notation "IDSQR3", scale factor BO, value 0.57735021. Value corresponds approximately to (1/1.732051), or the reciprocal of \(\sqrt{3}\).
\(K_{2 p i}:\) Constant, program notation "PI/4.0", scale factor B3, value 0.785398164 . Value corresponds to \(2 \times 3.141592656 \times 2^{-3}\), or approximately \(2 \pi \times 2^{-3}\), to convert between angle measurements in units of revolutions and radians.
\(K_{60 \text { secdp }}\) : Constant, program notation "60SECDP", scale factor B28, units centi-seconds. Value is \(6000 \times 2^{-28}\), corresponding to 60 seconds: if \(T_{\text {now }}\) - VHFTTME is at least this amount, then an attempt can be made to obtain a new VHF mark in "REND3".
\(K_{\text {90mscalr }}\) : Single precision constant, program notation "90MSCALR", scale factor B9, units centi-seconds. Value is \(440_{8}\), or \(9 \times 2^{-9}\), corresponding to 9 centi-seconds (the time delay, when added to RADDEL, between initiation of radar read and completion of the shift pulses).
\(K_{\text {aearth }}\) : Constant, program notation "AFARTH", scale factor B29, units meters. Value is \(6378166 \times 2^{-29}\), the Fischer model equatorial earth radius.
\(\underline{K}_{\text {cat }}\) : See Inflight Alignment.
\(K_{\text {convrnge }}\) : Constant, program notation "CONVRNGE" scale factor Bl3, units of (meters/bit). Value is \(18.52 \times 2^{-13}\), corresponding to a VHF ranging system bit weight of 18.52 meters (or 0.0100 nmi ). A value of ( \(2^{14} \mathrm{~K}\) gnvrnge ) corresponds to the weight of bit 15 , normally the "sign", of \(k \not M_{1}{ }^{\circ}\)
\(K_{\text {ft999 }}\) : Constant, program notation "FT99999", scale factor B19, units meters. Value is \(30479 \times 2^{-19}\), corresponding to \(99996.72 \times 0.3048\) \(\times 2^{-19}\), where first term is value in feet (display would be expected to show 99997 feet), second converts to meters, and third is scale factor.
\(K_{i m u v a r}\) : Constant, program notation "IMUVAR", scale factor B-16, units radians \({ }^{2}\). Value is \(0.04 \mathrm{E}-6 \times 2^{16}\), corresponding to \(0.04 \mathrm{mr}^{2}\).
\(K_{\text {jcaxis }}\) : Vector constant, program notation "JCAXIS", scale factor BI, value ( \(0.268819062,0,0.421587846\) ). True values correspond to \((0.537638124,0,0.843175692)\), or \((\sin \theta, 0, \cos \theta)\), where the angle is approximately the same as that defined in [NB1NB2] (see Coordinate Transformations): the octal matrix element for the sine is one least increment larger than that in \(K_{j c a x i s}{ }^{\circ}\)
\(K_{\text {matscalr }}\) : Single precision constant, program notation "-DTSCALR", scale factor B9, units centi-seconds. Value is 77754 g, corresponding to -23 g, or -0.59375 centi-seconds (a measure of when the shift pulses are sent to the radar).
K onedc: Constant, program notation "ONE/C", scale factor B-21 , units of (meters/centi-second) \({ }^{-1}\). Value is \(0.333564049 \mathrm{E}-6 \times 2^{21}\), corresponding to ( \(1 / 2.997925 E 6\) ) \(\times 2^{21}\), where first term is reciprocal of speed of light in meters/centi-second (corresponds to 9.835712 E 8 fps ) and second is scale factor.
\(K_{\text {radmoon }}\) : Constant, program notation "RADMOON" scale factor B29, units meters. Value is \(1738090 \times 2^{-29}\), the mean lunar radius.
\(K_{\text {sxtvar }}\) : Constant, program notation "SXTVAR", scale factor B-16, unizts radians \({ }^{2}\). Value is \(0.04 \mathrm{E}-6 \times 2^{16}\), corresponding to \(0.04 \mathrm{mr}^{2}\).
\(K_{\text {trunl9 }}\) : Constant, program notation "TRUN19", scale factor B0, units revolutions. Octal value is \(01604 \mathrm{~g} 00000_{\text {g }}\), used to correct TRUNION for the built-in bias. Decimal value is \(900 \times 2^{-14}\), or \(\left(7200 \times 2^{-3}\right) \times 2^{-14}\), where the 7200 is the complement of the optics trunnion "zero" value (see \(K_{2}\) in Optics Computations), and the \(2^{-3}\) is scale factor compensatiogs (from B-3 to BO revolutions).
\(K_{\text {trunvar }}\) : Constant, program notation "TRUNVAR", scale factor B-18, units radians \({ }^{2}\). Value is \(2.5 \mathrm{E}-9 \times 2^{18}\), corresponding to \(0.0025 \mathrm{mr}^{2}\).
\(K_{\text {varsubl }}\) : Triple precision constant, program notation "VARSUBL", scale factor B 40 , units meters \({ }^{2}\). Value is \(3.429904 \mathrm{E} 6 \times 2^{-40}\), corresponding to \((1852)^{2} \times 2^{-40}\), or the square of one nautical mile expressed in meters. In the listing, program sets the most significant one-third of the constant 0 (and uses the fact that it is zero elsewhere), and treats the least significant two-thirds as a double precision number, scale factor B26 (see \(C_{\text {rvarmin }}\) ).
LANDMARK: See Orbital and Rendezvous Navigation.
LEMPOS: Value of LM position vector, scale factor B29 (earth) or B27 (moon), units meters.

MARKDOWN+i ( \(i=0-6\) ): Set of optics mark information (double precision time, \(C D U_{y}\), optics shaft, \(C_{z}\), optics trunnion, and \(C D U_{X}\) respectively) intended for downlink transmission in programs making use of optics data. For P23, cells loaded in "P23.60" with measurement data, and in "MARKDIF" if get an R57 mark. Address is selected in "SXTSM" if STARIND \(=0\). For P51 - P54, this means the BESTI body being marked; for P22 and R22, since STARIND set 0 in "ROO", the cells are also loaded (due to performance of part of "SXTSM" via "GETUM"). MARKDOWN+7 is the same cell as RM.

MARKTIME: Cells used to contain time of mark information for R22 and P23, and as a communication cell with "SETINTG" (for which only first 2 cells are employed, scale factor B28, units centi-seconds). Used in R22 as the first 2 cells of a 7-cell buffer to contain optics mark data being processed, as loaded from MRKBUFl cells in "RENDI".

MRKBUF1: See Optics Computations.
N49DISP: Magnitude of position state vector change for display in RI of N49, scale factor B29, units meters. The magnitude is calculated as the square root of the sum of the squares of individual components of DELTAX \({ }_{0}\), where the squares are carried triple precision. Hence if a given component is of insufficient magnitude to be retained triple precision when squared, that component will contribute 0 to the sum: since for triple precision scaled \(B O\) the least increment is \(2^{-42}\), this means that for a component to have an input it must be at least. \(2^{-21}\). For earth scaling, this would correspond to \(2^{8}\) (256) meters and for moon scaling \(2^{6}\) (64) meters. Hence if all three components of DELTAX \({ }_{0}\) are less than \(256 / 64\) meters (earth/moon), N49DISP will display zero; 256 meters is about 0.14 nmi , while Rl of N49 least increment is 0.01 nmi .

N49DISP+2: Magnitude of velocity state vector change for display in R2 of N49, scale factor B7, units meters/centi-second. Magnitude is calculated in a manner analogous to N49DISP, using DELTAX instead of DELTAX \({ }_{0}\). The effect, however, is considerably less, since for earth scaling least increment on square is \(2^{-14}\) meters/centi-second and for moon \(2^{-16}\) meters/centi-second: these correspond to about 0.02 fps and about 0.005 fps respectively, while the display least increment is 0.1 fps. See C \(\mathrm{Vmax}^{\text {. }}\)

N49DISP44: Single precision cell, scale factor Bl4, used to display in R3 of N49 (for R22 only) information on the source of the update generating the display. It is set to 1 in "REND"" for optics data and 2 for VHF ranging data.
[NB1NB2]: See Coordinate Transformations. First row is NB1NB20, second row is \(\mathrm{NBlNB}_{3}\), and third row is \(N B 1 N B 2_{6}{ }^{\circ}\)
\(\mathrm{NUV}_{\mathrm{cm}}\) : See Orbital Integration.
OLDMKTME: Time of previous mark, scale factor B28, units centi-seconds, loaded in "REND12" and used in "AUTOW" logic.
OMEGA \({\underset{-}{0}}\), OMEGA \({\underset{1}{1}}^{\text {, OMEGA }}{ }_{2}\) : Weighting vectors for measurement incorporation of DELTAQ measurement (to give a "statistically optimum linear estimate of the deviation from the estimated state vector"). Scale factors of OMEGA, and OMEGA are B39, while the scale factor of OMEGA is B2O. This scaling is for no \(\underline{Z}_{i}\) rescaling.
\(\mathrm{OMEGAM}_{0}\), OMEGAM \({ }_{-1}\), \(\mathrm{OMEGAM}_{2}\) : Values of OMEGA. multiplied by GAMMA, used in "INCORP2" for updating W matrix information. Scale factor depends on scaling of GAMMA: if NORMGAM \(=0\) (see GAMMA), then scale factor of OMEGAM and OMEGAM \({ }_{2}\) is \(B-1\), and for OMEGAM scale factor is B-20. Program notations for these quantities are "OMEGAM1", "OMEGAM2", and "OMEGAM3" respectively.

OPTMODES: See Optics Computations.
PBODY: See Orbital Integration.
PDA: Value of intermediate quantity "A" in "HORIZ", scale factor Bl8, stored in push-down list location 16D. The ratio \((\sqrt{A-1}) / A\) is stored in push-down list location 28D, scale factor BO.

PDAH: Value of semi-major axis used to define shape of horizon ellipse in "HORIZ", scale factor B29, units meters, stored in push-down list location 2D.

PDALPHA: Value of intermediate quantity computed in "HORIZ", scale factor B29, units meters, stored in push-down list location 24 D .

PDAONE: Value of intermediate quantity "A " computed in "HORIZ", scale factor B2, stored in push-down list \({ }^{1}\) location \(24 D\).

PDAZERO: Value of intermediate quantity "A " computed in "HORIZ", scale factor B2, stored in push-down list location 22D.

PDBETA: Value of intermediate quantity computed in "HORIZ", scale factor B29, units meters, stored in push-down list location 26D.

PDBH: Value of semi-minor axis used to define shape of horizon ellipse in "HORIZ", scale factor B29, units meters, stored in push-down list location OD.

PDR프: Value of RZC transformed to Horizon Coordinate System, scale factor B29, units meters, stored in push-down list location 4 D .

PDUSH: Value of STARSAV2 transformed to Horizon Coordinate System, scale factor Bl, stored in push-down list location lOD.

PDVCT \({ }_{0}\) : Vector defining "point of tangency from PDRH to horizon", scale factor B29, units meters, stored in push-down list location 28D.
\(\mathrm{PDVCT}_{1}\) : Vector defining the other point of tangency to horizon, scale factor B29, units meters, stored in push-down list location 16D.

POINTEX: Single precision cell used to retain return address information from "WAITONE".

POINTVSM: See Attitude Maneuvers.
QPRET: See Orbital Integration.
QREG: Computer Q register (cell \(0002_{8}\) ), loaded with S-register information for computer TC orders, and also used in some cases for temporary storage of other information. As used in "RENDISP2", apparently expected to contain a positive non-zero number (as would be true for a TC order use). The actual sampling of QREG takes place in the program service routine "BANKJUMP", which is entered at the end of "ENDRET2"to return to the "PRIODSP" caller.
\(\underline{R}_{\text {other }}\) : See Orbital Integration.
R61CNTR: See Orbital and Rendezvous Navigation.
RADDEL: Single precision time until the 100 pps pulse initiating radar read sequence (loaded in "RADSTART"), scale factor B9, units cent1-seconds.

RADTIME: Single precision storage for the complement of the contents of channel 4, scale factor B9, units centi-seconds, as sampled when bit 4 of channel 13 was set to initiate radar reading.

RATETEMP: Temporary storage cell used in "HORIZ" to contain horizonaltitude correction information, scale factor B29, units meters. TRKMKCNT is the least significant half of the cell and VHFCNT is the most significant half. Also see Optics Computations.

RCLL: Tag assigned to value of (RI - RZC) in this document, scale factor B29, units meters. Left in MPAC when exit from "POINTAXS"/"HORIZ".
RCLP: Value of (IEMPOS - CSMPOS) for R22, scale factor B29 (earth) or B27 (moon), units meters.
\(R C V, R C \underline{c m}_{c m}, R_{-1 m}\) : See Orbital Integration.
RM: Single precision value of measured range sampled from RNRAD cell, scale factor B14, units counts (one VHF count is 0.01 nmi ). The cell is the same as MARKDOWN+7 (for telemetry purposes).

RNRAD: Single precision special erasable memory cell 0046 , into which VHF range data is shifted under hardware control if bits \(4-1\) of channel 13 are set to \(1001_{2}\). When shifting is complete, program interrupt \#9 is generated, causing entrance to "VHFREAD".

RZC: Value of position vector to the body with which the horizon or landmark measurement in P23 is made, scale factor B29, units meters.

SCAXIS: See Attitude Maneuvers.
SRTEMP: Exit address (single precision) from "R60CALL".
STARCODE: See Inflight Alignment. Mentioned in comments of this section.
STARIND: See Inflight Alignment.
STARSAV2: See Inflight Alignment: in P23 used for \(K_{\text {cat }}\) (or N88) information which is employed by R52, with notation "US".

STARSAV3: See Inflight Alignment.
Tet, TDELTAV: See Orbital Integration.
TEMPORI: Single precision cell, scale factor Bl4, used in the "RENDISP"/"RENDISP2" interface to determine when an answer to the 0649 display is received (when value becomes non-zero) and to conclude that this answer was PRO if negative and that it was a recycle if it was positive (see QREG). This method is employed to avoid display conflicts (with e.g. R60 P2O display), and will cause the computer activity light to remain on until the display is answered.

TNIV: Sẹe Orbital. Tntegration.
TRIPA: Triple precision value of sum of VARIANCE and \(\left|\underline{Z}_{i}\right|^{2}\) computed in "INCORP1", scale factor B40. It is used as the denominator value for computing the necessary weighting functions (a rounded version is used to multiply VARIANCE).

TRKMKCNT: Single precision cell, scale factor Bl4, giving a count of the number of optics marks (either primary optics or via R23) that have been completely incorporated into the state vector in R22 (it is incremented in "REND12"). It is set 0 in "DOFSTART", "P37E", and in "REND5C" (when initialize W matrix for R22 use). Cell is the "least significant half" of VHFCNT, and can be displayed as the 2 least significant digits in R3 of N45. The same cell is also used for RATETEMP+1 (see this writeup and Optics Computations).
TRUNBIAS: See Optics Computations.
TRUNION: Single precision value of measured optics trunnion angle for P23, loaded in "P23.60", scale factor B-3, units revolutions.

TX782: Temporary storage in "INCORP2" for updated value of X782, same scaling (not loaded into X782 unless bit 9(DMENFLG) of FLAGWRD5 \(=1\), as it would be for P22 but not for P23 or R22 of P20).
 define the transformation matrix from reference coordinates to the Horizon Coordinate System.

UCL: Value of unitRCLP computed in "REND7", scale factor Bl (a unit vector, of course).

UCLSTAR: Unit vector information, scale factor Bl, used in "P23.85" and "V94ENTER" for corrected vector to landmark/horizon. Cell also used for temporary storage purposes.

UM: Value of unit measurement vector derived in "GETUM", scale factor Bl: it gives the direction of the optics-measured information in reference coordinates.

USSTAR: Value of unit vector to celestial body computed in "P23.85", scale factor Bl (includes correction for velocity of light).

USTAR: Unit "fictitious star direction", scale factor Bl, updated in "BVECTORS" (initialized in "REND7" or P22). Two such quantities are used, "chosen to be perpendicular to each other and to the current estimated line-of-sight vector."
\(\underline{V}_{\text {other }}\) : See Orbital Integration.
VARIANCE: Triple precision variance associaled with the navipation measurement reflected in DELTAQ, scale factor B4O, units of meters \({ }^{2}\). The value for use in "INCORPI" is computed by the individual calling program based on a priori measurement errors.
\(\mathrm{VCV}, \mathrm{VCV}_{\mathrm{cm}}\) : See Orbital Integration.

VHFCNT: Single precision cell, scale factor B14, giving a count of the number of VHF range marks that have been incorporated into the state vector in R22 (it is incremented in "REND12"). It is reset to 0 at the points listed for TRKMKCNT (which is the "least significant half" of VHFCNT), and it can be displayed as the 2 most significant digits in R3 of N45. Same cell used for most significant half of RATETEMP (see this writeup and Optics Computations).

VHFRANGE: Value of incoming VHF range measurement (a scaled version of the 15-bit integer in RM), scale factor B27 (earth or moon), units meters, computed in "RANGERDI". If reading unsuccessful, used instead to control lighting of Tracker light in "LIGHTON".

VHFTIME: Value of computer clock when last VHF range sample was made, scale factor B28, units centi-seconds. It is initialized to present computer clock in "R22", and if more than \(K_{60 \text { secdp }}\) have elapsed since it was last loaded (see "REND3" logic), then another sample attempt is initiated. It is set to MARKTIME in "LIGHTON" (sample not successful) or "RANGERDI" (sample successful): MARKTIME is set to T in "RADSTART" (just after setting channel 13 bits to initiate sample, but after releasing interrupts that were inhibited during channel 13. setting).

VZE: Value of vehicle velocity vector for P23 computed in "POINTAXS", scale factor B 7 , units meters/centi-second (same scaling for earth or moon).
\(\left[W_{i}\right], W_{i}, W_{i}\) : Notations used to describe portions of the "W" (error transition) matrix stored in the computer memory: the complete matrix consists of 9 rows and 9 columns, giving 81 elements. Each element in the memory is stored double precision, so that the last element would have the notation " \(\mathrm{W}+160\) " in the program. For simplicity, however, this incrementing of addresses by 2 has been suppressed in the programmed equations (indices are shown scaled B13 instead of \(\mathrm{Bl}_{4}\) ), so that the first element is called \(W_{O}\), the next \(W_{1}\), and the last element \(W_{80}\). Computations carried out by vector operations on three elements at a time are designated by the usual vector notation with the subscript being that of the first element involved: \(\underline{W}_{3}\), for example, is the "vector" made up of \(\left(W_{3}, W_{4}, W_{5}\right)\).
Other manipulations in the program make use of the \(3 \times 3\) matrix computation capabilities of the interpretive language. For convenience in description, the indices for these \(3 \times 3\) matrices run from 0 to 8 (all matrix operations shown are \(3 \times 3\) ), with the index determined by the index of the first element divided by 9: \(\left[W_{2}\right]\) would be the matrix with rows made up of \(W_{1}, W_{21}\), and \(W_{24}\) ' tor example. The complete \(9 x 9\) matrix is made up ot these \(24 \times 3\) matrices, with the first three rows being \(\left[W_{0}\right],\left[W_{1}\right]\),
and \(\left[W_{2}\right]\); the middle the rows \(\left[W_{3}\right],\left[W_{4}\right]\) and \(\left[W_{5}\right], W_{3}\) For a \(6 \times 6\) (P20 and P23) instead of \(9 \times 9\) (P22) Wmatrix application, only \(\left[W_{0}\right],\left[W_{1}\right],\left[W_{3}\right]\), and \(\left[W_{4}\right]\) are employed.

Initialization of the \(W\) matrix involves initializing the diagonal elements of \(\left[W_{0}\right]\) with the appropriate position uncertainty information and the diagonal elements of \(\left[W_{4}\right]\) with the appropriate velocity uncertainty information: see P22 computations for the initialization performed for landmark information.
The scale factor of all elements of a given \(3 \times 3\) matrix is the same. For matrix \(\left[W_{j}\right]\), with \(i=0,1,2,6,7,8\), the scale factor is B19 in units of meters; for \(i=3,4,5\), the scale factor is \(B O\) in units of meters/centi-second.

WMIDPOS: Single precision value of W matrix initialization for position information ( \(\left[W_{0}\right]\) ), scale factor B19, units meters. Can be updated by "V67CALL", and also would be expected to form part of prelaunch load: it is used in "POINTAXS" to initialize the W matrix for P23.

WMIDVEL: Single precision value of \(W\) matrix initialization for velocity information ( \(\left[W_{4}\right]_{\text {I }}\) ), scale factor BO, units meters/centi-second. Can be updated by "V67CALL", and also would be expected to form part of prelaunch load: it is used in "POINTAXS" to initialize the W matrix for P23.

WORBPOS: Single precision value of W matrix initialization for position information, scale factor Bl9, units meters. Can be updated by "V67CALL", and also would be expected to form part of prelaunch load: it is used in P22 for W matrix initialization.

WORBVEL: Single precision value of \(W\) matrix initialization for velocity information, scale factor BO, units meters/centi-second. Can be updated by "V67CALL", and also would be expected to form part of prelaunch load: it is used in P22 for W matrix initialization.

WORKW: Temporary storage cell used in the conversion of a 6 x 9 matrix to 6x6 form. Corresponds to push-down list location OD.

WRENDPOS: Single precision value of \(W\) matrix initialization for position information, scale factor B19, units meters. Can be updated by "V67CALL", and would be expected to form part of the prelaunch load. It is also loaded (if final pass and in minimum key rendezvous mode) in "VN1645" with K It is used in "REND5C" to initialize the posvelt (atix for R22.

WRENDVEL: Single precision value of \(W\) matrix initialization for velocity information, scale factor BO, units meters/centi-second. Can be updated by "V67CALL", and would be expected to form part of the prelaunch load. It is also loaded (if final pass and in minimum key rendezvous mode) in "VN1645" with K It is used in "REND5C" to initialize the

WWOPT: Single precision cell, scale factor Bl4, used in "V67CALL" to specify whether the matrix initialization elements are to be changed, and if so which set. The value when displayed initially in R3 of N99 is 0 . A non-zero value means a change desired, with a value of 1 (or negative non-zero) changing WRENDi; a value of 2 changing WORBi; and a value in excess of 2 changing WMIDi.

WWPOS: Quantity displayed in R1 of N99, scale factor Bl9, units meters. It provides the present \(W\) matrix position error. If the loading option is selected, is used as source for WiPOS information.

WWVEL: Quantity displayed in R2 of N99, scale factor BO, units meters/ centi-second. It provides the present \(W\) matrix velocity error. If the loading option is selected, is used as source for WiVEL information.

X782: Value of estimated landmark location, scale factor B29 (earth) or B27(moon), units meters, as updated by results of measurement incorporation routines.
\(\underline{Z}_{0}, \underline{Z}_{1}, \underline{Z}_{2}\) : Measurement vector information, scale factor B2O, units meters, computed at the start of "INCORPI". Subsequently rescaled.```
