

Maui A

This unit was proposed as critical habitat for 16 species: *Alectryon macrococcus*; *Clermontia oblongifolia* ssp. *mauiensis*; *Colubrina oppositifolia*; *Ctenitis squamigera*; *Cyanea glabra*; *Cyanea lobata*; *Cyrtandra munroi*; *Gouania vitifolia*; *Hedyotis mannii*; *Hesperomannia arbuscula*; *Phlegmariurus mannii*; *Platanthera holochila*; *Plantago princeps*; *Pteris lygatei*; *Remya mauiensis*; and *Sanicula purpurea*. We excluded the proposed critical habitat on ML&P lands because the benefits of excluding them outweighed the benefits of inclusion (see "Analysis of Impacts Under Section 4(b)(2): Other Impacts"). Proposed critical habitat in Maui A for *Colubrina oppositifolia*, *Plantago princeps*, and *Pteris lygatei*, all multi-island species,

was excluded. This area is not essential to the conservation of these three species because it has a lower proportion of associated native species and more nonnative species than other areas we consider to be essential to the conservation of these three species. In addition, there are at least eight other locations for each of these species within their historical ranges on Maui and other islands which provide habitat essential for their conservation and which are either designated as critical habitat in this final rule or have been designated or proposed for designation in other rules.

The area designated as critical habitat for the Maui endemic species, *Remya mauiensis*, provides habitat within its historical range for two populations. The area designated as critical habitat for the following multi-island species

provides habitat for two populations of *Alectryon macrococcus*; three populations each of *Clermontia oblongifolia* ssp. *mauiensis*, *Ctenitis squamigera*, and *Cyanea glabra*; two populations of *Cyanea lobata*; four populations of *Cyrtandra munroi*; one population of *Gouania vitifolia*; two populations each of *Hedyotis mannii* and *Hesperomannia arbuscula*; one population each of *Phlegmariurus mannii* and *Platanthera holochila*; and three populations of *Sanicula purpurea* within their historical ranges.

These modifications resulted in the reduction from 3,884 ha (9,598 ac) to 1,632 ha (4,033 ac). This unit was renamed Maui 17—*Alectryon macrococcus*—d, 17—*Alectryon macrococcus*—e, 17—*Clermontia oblongifolia* ssp. *mauiensis*—a, 17—*Clermontia oblongifolia* ssp.
