

separated from the other five units designated as critical habitat for this island-endemic species, in order to avoid all recovery populations from being destroyed by one naturally occurring catastrophic event.

Oahu 35—*Delissea subcordata*—f

This unit is critical habitat for *Delissea subcordata* and is 129 ha (317 ac) on State and private land. This unit contains a portion of Kulepiamoa Ridge, Pia Valley, and Kupaua Valley. This unit provides habitat for one population of 300 mature, reproducing individuals of the short-lived perennial *Delissea subcordata* and is currently unoccupied. This unit is essential to the conservation of the species because it includes habitat that is necessary for the establishment of additional populations on Oahu in order to reach recovery. The habitat features contained in this unit that are essential for this species include, but are not limited to, moderate to steep gulch slopes in mixed mesic forests. This unit is geographically separated from the other five units designated as critical habitat for this island-endemic species, in order to avoid all recovery populations from being destroyed by one naturally occurring catastrophic event.

Oahu 35—*Diellia erecta*—a

This unit is critical habitat for *Diellia erecta* and is 293 ha (731 ac) on private and State land (Honolulu Watershed Forest Reserve). This unit contains a portion of Kulepiamoa Ridge and Laulaupoe Gulch. This unit provides habitat for one population of 300 mature, reproducing individuals of the short-lived perennial *Diellia erecta* and is currently unoccupied. This unit is essential to the conservation of the species because it supports habitat that is necessary for the establishment of additional populations on Oahu in order to reach recovery goals. The habitat features contained in this unit that are essential for this species include, but are not limited to, moderate to steep gulch slopes or sparsely vegetated rock faces in mesic forest. This unit is geographically separated from critical habitat designated elsewhere on Oahu and on Kauai, Molokai, and Maui for this species in order to avoid all recovery populations being destroyed by one naturally-occurring catastrophic event.

Oahu 4—*Diellia falcata*—a

This unit is critical habitat for *Diellia falcata* and is 59 ha (148 ac) on State land (Pahole NAR and Mokuleia Forest Reserve). This unit provides habitat for one population of 300 mature,

reproducing individuals of the short-lived perennial *Diellia falcata* and is currently unoccupied. This unit is essential to the conservation of the species because it supports habitat that is necessary for the establishment of additional populations on Oahu in order to reach recovery goals. The habitat features contained in this unit that are essential for this species include, but are not limited to, deep shade or open understory on moderate to moderately steep slopes and gulch bottoms in diverse mesic forest. This unit is geographically separated from the other three units designated as critical habitat for this island-endemic species, in order to avoid all recovery populations from being destroyed by one naturally occurring catastrophic event.

Oahu 4—*Diellia falcata*—b

This unit is critical habitat for *Diellia falcata* and is 22 ha (54 ac) on State land (Pahole NAR and Mokuleia Forest Reserve). This unit provides habitat for one population of 300 mature, reproducing individuals of the short-lived perennial *Diellia falcata* and is currently occupied by 20 individuals. This unit is essential to the conservation of the species because it supports an extant colony of this species and includes habitat that is necessary for the expansion of the present population, which is currently considered nonviable. The habitat features contained in this unit that are essential for this species include, but are not limited to, deep shade or open understory on moderate to moderately steep slopes and gulch bottoms in diverse mesic forest. This unit is geographically separated from the other three units designated as critical habitat for this island-endemic species, in order to avoid all recovery populations from being destroyed by one naturally occurring catastrophic event.

Oahu 15—*Diellia falcata*—c

This unit is critical habitat for *Diellia falcata* and is 341 ha (844 ac) on State, Federal (Lualualei Naval Reservation), and private land (Honouliuli Preserve). This unit contains a portion of Puu Hapapa, Puu Kanehoa, and Puu Kaua. This unit provides habitat for 4 populations of 300 mature, reproducing individuals of the short-lived perennial *Diellia falcata* and is currently occupied by 297 individuals. This unit is essential to the conservation of the species because it supports an extant colony of this species and includes habitat that is necessary for the expansion of the present population, which is currently considered nonviable. The habitat features

contained in this unit that are essential for this species include, but are not limited to, deep shade or open understory on moderate to moderately steep slopes and gulch bottoms in diverse mesic forest. This unit is geographically separated from the other three units designated as critical habitat for this island-endemic species, in order to avoid all recovery populations from being destroyed by one naturally occurring catastrophic event.

Oahu 15—*Diellia falcata*—d

This unit is critical habitat for *Diellia falcata* and is 178 ha (437 ac) on State, Federal (Lualualei Naval Reservation), and private land (Honouliuli Preserve), containing a portion of Palikea Summit. This unit provides habitat for 3 populations of 300 mature, reproducing individuals of the short-lived perennial *Diellia falcata* and is currently occupied by 1,230 individuals. This unit is essential to the conservation of the species because it supports an extant colony of this species and habitat that is necessary to reach recovery goals. The habitat features contained in this unit that are essential for this species include, but are not limited to, deep shade or open understory on moderate to moderately steep slopes and gulch bottoms in diverse mesic forest. This unit is geographically separated from the other three units designated as critical habitat for this island-endemic species, in order to avoid all recovery populations from being destroyed by one naturally occurring catastrophic event.

Oahu 15—*Diellia unisora*—a

This unit is critical habitat for *Diellia unisora* and is 362 ha (894 ac) on State, Federal (Lualualei Naval Reservation), and private land (Honouliuli Preserve). This unit contains a portion of Palikea Summit, Laikea Trail, Pohakea Pass, Puu Kanehoa, and Puu Kaua. This unit provides habitat for 6 populations of 300 mature, reproducing individuals of the short-lived perennial *Diellia unisora* and is currently occupied by 697 plants. This unit is essential to the conservation of the species because it supports an extant colony of this species and includes habitat that is necessary for the establishment of additional populations. The habitat features contained in this unit that are essential for this species include, but are not limited to, moderate to steep slopes or gulch bottoms in deep shade or open understory in mesic forest. We do not believe that enough habitat currently exists to reach the recovery goal of 8 to 10 populations for this species, but this unit is large enough that one naturally occurring
