

### [10.5] Use *tmpcnv()* to display temperature conversion equations

*tmpcnv()* usually performs temperature conversion on numbers, for example

```
tmpcnv(0_°C, _°F)
```

results in 32\_°F. You can also use *tmpcnv()* to display the temperature conversion equations, if you convert an undefined variable, like this:

```
tmpcnv(TF*_°F, _°C)
```

which gives the result

```
0.5556 · (TF-32) · _°C
```
