Revision 98 of COMANCHE was GOOD and has been designated as the COLOSSUS 2E pre-release. The following changes were incorporated into Revisions 97 & 98.

- TRUNFLAG was deleted. The implementation of PCR 963 made this flag obsolete.

- Changes were made to P15 and the RESTART TABLES to correct restart capabilities. (PCR 973)

- The initial TVCEXEC delay was changed from .5 sec. to .51 secs. to reduce loss of downlist information. (PCR 1020)

- RCS FRESHDAP was modified to reduce execution time. (ACB 113)

- The new assembler operator (=ECADR) was incorporated in the Absolute Locations for Update Log section to eliminate the use of the fixed memory used in the original implementation of ACB 100.

- UPSUM had to be redefined equal to VHFRANGE + 1 instead of VHFRANGE because of an erasable conflict.

Changes to Colossus GSOP
The following items should be examined for inclusion in the GSOP sections indicated.

Section 2 (Item 1)
Section 3 (Item 3)

Known Anomalies in Revision 98 of Comanche:
COM34, COM35, COM36

Approved PCR's not included in Revision 98 of Comanche:
PCR 954, PCR 995, PCR 315.1

It should be noted that PCR 984 is not included in Revision 98 of Comanche, but will be incorporated in a future revision if PCR 954 isn't incorporated. PCR 954 supersedes PCR 984.
